Weekly by section and overall, lists all current patents in patentee code order and, within a given patentee, in earliest priority date order. The first line gives patentee code, earliest priority date, patentee name, CPI classes and finally the current patent number. The second line gives the first part of the title, followed by the accession number.

CPI CLASS INDEX (IV)

Weekly only. Headings are all the CPI classes within the section to which an Alerting Bulletin relates, arranged in numerical order. Posted under each class heading is a list, in country then patent number order, of all basic or equivalent documents referenced or cross-referenced under that heading.

In Country Alerting Bulletin only

BASIC NUMBER INDEX (V)

Weekly by section and overall, lists all entries by accession number. Each heading consists of the accession number in bold, followed by the CPI section letters. There then follows a list of all the family members, commencing with the basic and finishing with the current week's patent. For each family member the CPI week of issue is quoted, and a plus sign indicates that a multiple priority has been claimed.

PATENT NUMBER INDEX (VII)

Weekly by section and overall. Lists left to right the patent type (* for basic, = for equivalent or ≠ sign for non-convention equivalent or where the priority has been artificially "added" to the specification), patent number, accession number and CPI classes.

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A—M cumulations of from a quarter up to 5 years are available as COM.

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180
Europe	150
France	740
Germany, W. unexamined	1050
Japan unexamined	845*

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

MORG D11 06160Y/04 =DS 2631-863
Continuous pastry rolling machine - with coiling roller, stop and serrated plate facing belt conveyor
MORINAGA & CO LTD 19.05.76-JA-058429 (19.07.75-JA-088955)
(06.12.79) *DT2631-863 A21c-15

The winding cylinder runs at a slower speed than the belt transporting the flat cakes from the oven in which they have been baked, and are not yet cooled, to the delivery point for the wound bread rolls, of a machine working continuously and automatically.

The flat cakes pressed by the belt, curve round the surface of the winding cylinder until their leading edges contact a stop, so that a partly rolled bread cake results.

Attached to the stop and parallel to the conveyor belt, a rail is provided which works with the belt to roll the cakes into a full circle, cleanly, uniformly and without damage. 15.7.76 as 631863 Add in 2759095 (10pp1045).

SPEY- ★ D11 89808B/50 ★EP ---5-977
Oral admin. of large doses of anticholesterolaemic carbohydrate gums - as bread or crisp-bread stabilised with additional gluten
SPEYWOOD LABS LTD 02.10.78-GB-039008 (30.05.78-GB-024163)
A96 B04 (A97) (12.12.79) A21d-02/18
D/S: E(BE, CH, DT, FR, IT, NL, OE, SW).

Bread comprises flour, 5 to 50% non-absorbable, non-toxic carbohydrate gum and sufficient gluten to stabilise the structure of the bread. The carbohydrate gum is guar gum, locust bean gum, pectin or a water-soluble non-toxic alkyl-cellulose.

The bread provides a means of administering the large amts. (10-30g) of carbohydrate gum required each day to reduce blood cholesterol and glucose levels. It is preferably in the form of a crispbread rather than ordinary bread, as this has a longer shelf life.

25.5.79 as 300957 (13pp916).

AMFI ★ D11 89912B/50 ★GB 2021-919
Packaged hamburger buns with opposed slits - separated by diagonal bridge forming frangible web
AMERICAN FILTRONA CORP 02.06.78-US-911855
P62 (12.12.79) A21c-15/04 B26d-03/12

Hamburger buns are slit by advancing them past a pair of contrarotating blades lying in a common plane. After the blades have penetrated the bun, a thin web remains to link the upper and lower portions of the bun. Pref. the bun is sandwiched between a pair of conveyor belts which prevent its rotation while being engaged by the blades.

The bun is packaged and may be subsequently divided into halves to receive a hamburger patty. The halves of the bun may be toasted but the remnants of the web do not char. 14.2.79 as 005171 (4pp295)

HEIG- ★ D11 89917B/50 ★GB 2021-964
Dough mixer with temp. controlled jacket - together with multi-vaned mixing device
HEIGHT INC 31.05.78-JA-065491
J02 (12.12.79) B01f-07/16 B01f-15/06

Mixer includes a mixing device comprising a plate mounting a central, rotatable shaft having vanes. Each vane includes an upper portion, fixed to the shaft by radially-extending arms, and pointing in the forward direction of rotation. The lower portion of the vanes is fixed via a vertical plate to the plate, the lower portion defining a trailing end. Scraping vanes are provided around the periphery of plate.

The mixing device is mounted within a temp-regulated tub.

The mixer enables the rapid formation of the glutenous state of bread dough, and by using a cooling jacket avoids over-heating of the dough. 29.5.79 as 018710 (10pp1050)

Storage-stable rice powder noodles mfr. - by mixing rice powder with flour protein and powdered flour and/or starch and then with (salt) water contg. sodium(hydrogen) phosphate
MIYATAKET 21.04.78-JA-047286
(01.11.79) A231-01/16

Rice powder is mixed with flour protein and flour powder and/or starch and then mixed with salt water or mineral water contg. a small amt. of sodium monohydrogen phosphate or sodium phosphate, followed by conventional procedure for prepn. of noodles. The amt. of flour protein used is 10 to 15 pts. wt. per 100 pts. wt. rice powder. The amt. of flour powder and starch used is twice the wt. or the same wt. as the flour protein. Conc'n. of phosphate in salt water or mineral water is 0.5 to 2%.

In an example, 100 pts. wt. rice powder, 15 pts. wt. flour protein and 15 pts. wt. flour powder are mixed. To the mixt. is added 50% mineral water contg. 1.5% sodium monohydrogen phosphate, followed by kneading and conventional procedure for prepn. of noodles. 21.4.78 as 047286 (2pp2)

HIRA/ D11 70795B/39 =J7 9038-185
Bread mfr. using flour and rice powder - with hot water extract of yeast and emulsifier(s) added to dough to improve quality
HIRANUMAY 03.02.78-JA-010529
(19.11.79) *J54105-255 A21d-02/36

The method comprises fermenting, kneading the main dough fermenting the main dough, finishing, roasting and burning. The dough is prepd. from flour 95-80 w/w %, rice powder 5-20 w/w %, yeast, water, etc. The dough is combined with 0.3-2.5 w/w % of the hot water extract of yeast and 0.2-1.0 w/w % of 1 emulsifier selected from glycerin fatty acid ester, sucrose fatty acid ester and sorbitan fatty acid ester.

Excellent bread can be prepd. without using viscosity increasing agent such as gluten, natural gum etc. The prepd. break is voluminous and of excellent colour, gloss, form, texture, taste and flavour, tissue etc. 3.2.78 as 010529, A21d-2/36 (19.11.79) HIRANUMAY (7pp) (J5 4105255)

KIFO= ★ D11 90819B/50 ★SU -655-375
Working chamber of bread-baking oven - has upper and lower hot gas ducts contg. corrugated reinforcing elements to increase their rigidity
KIEV FOOD IND TECHN 07.02.77-SU-452165
(09.04.79) A21b-01/10

Working chamber of bread-baking oven consists of upper and lower hot gas ducts with longitudinal corrugations. Construction is improved and labour required to mfr. the chamber is reduced, by making the corrugations with a V-shaped profile and disposing them on the outer walls of the heated gas ducts, with the apexes of the profiles connected to the inner walls of the gas ducts.

The screens thus divide the cavities of the gas ducts across their width so as to ensure some lengthwise rigidity in the chamber construction. The advantages of the design in the reduction of effort during construction are mentioned briefly.

Blender for homogenised pasty food mixes etc. - contains vaulted chamber with auger screw forcing mixture through tubes with angular nozzles of adjustable orientation

UKR FOOD MECH ENG 27.05.77-SU-489591
(05.04.79) A21d-10 B01f-05/10

The cylindrical vaulted working chamber of the food blender giving improved quality pasty food mixes contains auger screw which scoops the components from the bowl and forces them through the inlet of tubes mounted in even number around the circumference of the dome of the chamber.

Each tube at its outlet end contains deflecting nozzle clamped to it by a screw in adjustable orientation. The nozzle consists of a trough having two sections inclined to one another at an angle of 130-150°. The outlets of the nozzles on adjacent tubes are oriented in opposite direction.

MAMA/ ★ D11 90873B/50 ★SU-655-547
Glazing mouldable materials, clay, dough, etc. - by dipping cold mould into glazing liquid to form ice-type layer which is transferred onto shaped prod.

MAMAIII 14.07.77-SU-508590
102 P64 (09.04.79) B28b-11

Method for applying glazed coatings to the surfaces of articles made from plastic materials for use in the building, ceramic and food industries includes freezing the covering layer to the surface.

The quality of the coating is improved by applying the covering, prior to the article being shaped, on to the surfaces of a previously cooled mould.

The shaping surface is cooled to -10 to -20°C and a liquid material is applied to its surfaces. This is the material intended to be eventually coated on the shaped article by placing the latter into the mould. A thin crust of ice forms on the mould. The plastic prod. is put into the mould, and because its temp. is considerably higher than that of the mould, the incrustation melts on the mould surface, and a uniformly thin layer of the liquid forms on the prod. The thickness of the ice layer is regulated by the mould temp. and the immersion time.

Mamai I. I., Bul. 13/5.4.79 14.7.77 as 508590 (2pp29)

AUTO- ★ D11 90939B/50 ★US 4176-590
Doughnut frying appts. having conveyor through oil bath - with doughnuts inverted by paddles rotated by conveyor flights

AUTOMATED DONUT SYS 07.08.78-US-931387
P28 (04.12.79) A47j-37/12

Doughnuts are cooked in an elongated bath of hot oil through which they are carried by a conveyor with trans-

verse flights. A set of baffles extends from a shaft which extends transversely across the upper run of the conveyor and is engaged by the conveyor to rotate the shaft. The baffles receive a doughnut on their upstream face and lift it out of the bath before redepositing it inverted on the downstream side of the baffles. A doughnut is sandwiched between a railing and a leading baffle with the trailing baffle being longer than the leading baffle.

The appts. cooks doughnuts and inverts them during the cooking operation. 7.8.78 as 931387 (6pp295)

POWE/ ★ D11 90940B/50 ★US 4176-5
Cooking pan for baking pizza pies etc. - has perforated base reducing cooking time by direct heating of pizza portions

POWER D P 10.04.78-US-894744

P28 (04.12.79) A21b-03/13 A47j-27 A47j-36

A pan for cooking pizzas has a flat base with a surrounding wall. The base is perforated with holes each having a dia. of 1/4 inch and altogether the holes occupy 15-40% of the area of the base.

The base of the pan is 0.050 inch thick and each perforation is generally cylindrical apart from the upper end which is rounded. Pref. the pan is made of Al alloy and the side wall extends at an angle of 45° to the base.

A pizza dough is placed in the pan and is cooked. The perforations provide direct contact between portions of the pizza and the hot cooker. Moisture from the dough escapes through the perforations and prevents bubbling of the dough. 10.4.78 as 894744 (8pp295)

AMMA ★ D11 90989B/50 ★US 4177-030
Dough dividing by pushing through grid - by reciprocating piston with two stroke action purging dough from cylinder

AMF INC 01.05.78-US-901410

(04.12.79) B29c-01

A dough divider includes a reciprocating piston which advances dough through a dividing grid into receiving pocket in a movable head. Dough is stored in a hopper above the piston and feeds the cylinder when the piston is retracted. A cut-off knife disconnects the hopper dough from the cylinder and is activated when the piston is making its dough-dividing advance stroke.

After completing the dividing stroke the piston enters a purging stroke during which the cut-off knife is left in the open position while the piston is advanced. This purges unused dough from within the cylinder and returns it to the hopper where it mixes with fresh dough.

The apparatus divides dough into lumps of predetermined size. The purging stroke removes dough from the cylinder and prevents stagnation of dough within the cylinder. 1.5.78 as 901410 (6pp295)

D12: MEAT; FISH PROCESSING

MILE ★ D12 89424B/50 ★BE-878-109
Food product, esp. sausage, not requiring cooking oil - contg. elastic gluten modified by a reducing agent

MILES LABORATORIES INC 13.10.78-US-951196
(03.12.79) A23I

The product with autogenous cooking fat comprises modified hydrated elastic gluten obtd. by contact of a hydrated elastic gluten with a reducing agent and an oil. By 'with autogeneous cooking fat' is meant liberating appreciable amts. of fat or oil in cooking and therefore not requiring the addn. of oil in prepn.

Prepn. of sausage type meat analogues comprises (a) forming a mixt. comprising 25-93% of modified hydrated gluten obtd. by contact of a hydrated elastic gluten with 0.002-0.01 pt. of an edible reducing agent per pt. of dry gluten, 5-50% oil, 2-15% of flavourings and colourants, 0-40% of textured vegetable protein, 0-30% of non-denatured protein, 0-0.6% of vegetable gums and 0-25% of water and (b) heating the mixt. to give it a stable physical form

The treatment of the gluten renders it suitable for direct

incorporation in the mixt. whereas in its natural state it is not. The prods. obtd., which do not show any sepn., has excellent cooking properties. 6.8.79 as 878109 (13pp597)

BATT ★ D12 89452B/50 ★CH-614-351
Protein-contg. foodstuff film - produced by stretching on rollers and scraping from final roller to give fan-folded prod.

BATTELLE DEV CORP 10.05.74-CH-006392
(30.11.79) A23j-03

In the prodn. of a protein-contg. foodstuff, a mixt. of protein and water is processed into a film by passing it through a series of smooth, parallel, touching, rotating rollers, the film being passed successively from one roller to the next, each successive roller having a higher speed of rotation and an opposite direction of rotation to the preceding roller, and the film being removed from the last roller by means of a scraper set at an angle to the surface of the last roller. The mixt. of protein, water and other additives has a water content of 35-80 wt. %. the film is subjected to a stretching of ≥40% and on removal o

the film by the scraper, fan shapes are formed in which smaller folds are super-imposed on larger folds.

Used in prodn. of protein-contg. foodstuffs with a fibre-like structure, e.g. textured vegetable protein. Simple and economical process gives a prod. with good organoleptic properties with a texture closely resembling meat. 20.5.74 as 006392 (9pp280)

TECH = ★ D12 89526B/50 ★DT 2823-878
Fish filleting machine - with two roller supported cup-shaped cutters and spreader

TECH RYBPROM PROD 31.05.78-DT-823878
(06.12.79) A22c-25/16

This fish filleting machine has two cup-shaped filleting cutters, each supported on three back-up rollers. The cutting edges at the rim of each cup are directed opposite to the motion of the fish; they are coaxial and concentric to the side faces of a spreader which enters into a ventral cut.

This is a simple machine which produces fish fillets of high quality from which the backbone, side fishbones and dorsal fins are completely removed. 31.5.78 as 823878 (13pp39)

TAIY- ★ D12 89598B/50 ★DT 2855-127
Removing internal organs esp. kidneys of fish - using water jets as split fish passes horizontally between twin belts
TAIYO SEISAKUSHO MF 29.05.78-JA-063393
(06.12.79) A22c-25/14

Machine consists of a pair of horizontal conveyor belts, a splitting needle between the belts composed of two relatively flat metal sheets, tapering to form the point at each end of the needle with a rectangular aperture between the metal sheets in the centre. Fish are fed horizontally to the needle along a guide bar from a feed table.

The rectangular aperture in the splitting needle contains nozzle jets for jetting water to flush out the internal organs from the fish. In the central region between the upper and lower belts there is a pair of clamping devices and additional clamping devices are provided near the ends adjacent to the inlet rolls, and discharge rolls. These clamping devices apply pressure onto the conveyor belts via the support rolls. A lateral guide plate holds the fish in position against the force of the jets.

Used esp. for the prepn. of salmon or trout, specifically for canning. 20.12.78 as 855127 (16pp236)

FARH D12 87852B/49 =EP ---5-765
Tubular packing film, esp. sausage skins - of cellulose hydrate reinforced with fibres coated with a binder and an optically active substance

HOECHST AG (KALL) 26.05.78-DT-822886
A97 Q34 (A11 A21 A92) (12.12.79) *DT2822-886 A22c-13
D/S: E(BE, DT, FR, GB).

A tubular packing film of opt. chemically plasticised cellulose hydrate has a fibrous insert in the walls. At least part of the fibres are coated (partially) with a compsn. comprising a major proportion of a synthetic hydrophilic resin precondensate as binder and a minor proportion of an optically active chemical substance.

The fibrous insert is e.g. a paper fibre web coated with a compsn. comprising a urea-formaldehyde, melamine-formaldehyde or epichlorhydrin-polyamine-polyamide binder resin and an optically active substance such as a dye or light-protective agent. The web is coated with viscose soln., treated with a coagulating liq., opt. treated with a chemical plasticiser and dried.

The prods. are fibre reinforced cellulose hydrate materials with excellent strength properties. Formation of the cellulose hydrate structure is not hindered as in some prior-art processes where the optically active material is added to the viscose. The walls of the tube are comprised only of cellulose hydrate and opt. the plasticiser. The prods. are esp. useful as sausage skins.

Skin and retained hair are removed from a hog carcass by killing and bleeding a hog suspended from a conveyor, manually removing skin from the rear hock and head; slitting the skin along the teat strip to produce a skin flap, placing the skin flap between a gripper extending from a ditch opening in a drum; retracting the gripper into the ditch; clamping the flap in the drum; rotating the drum; and scraping the skin from the hog as the skin is pulled around the drum.

The skin can be removed undamaged and without need of dehairing. 17.10.77 as 043102 (25pp1376)

Tool cutting and cleaning fish abdominal cavity - with circular rotating blade sandwiched between blunt toothed discs
NORDISCH MASCH R BAADER 09.12.77-GB-051278
P62 (12.12.79) B26b-25

Tool comprises a circular knife with a peripheral cutting edge sandwiched between a pair of toothed discs. The swept dia. of the discs is about 2 mm less than the dia. of the circular knife and pref. spacing washers are interposed between the discs and knife to establish their separation. Pref. the cutting edge of the circular knife is formed by chamfering both its edges and it may also be interrupted by radially extending notches. The teeth of the discs have blunt faces and may be undercut. Pref. the discs and knife are locked together by a rod which passes through them.

The tool slits and cleans the abdominal cavity of a fish. The toothed discs do not cause injury to the belly cover yet accomplish the clean removal of the guts of soft fish. 9.12.77 as 051278 (4pp295)

Chilling poultry carcasses in tank - with impeller advancing carcass to succeeding tank

COPE WHELOH & CO 17.11.76-GB-047904
Q75 (12.12.79) F25d-13/06

A chilling tank is filled with water which additionally washes poultry carcasses placed in the tank. The carcasses are advanced through the tank and discharged via a chute by an impeller which positively advances the carcasses at a predetermined rate. The impeller drive remains above the water in the tank. Pref. the impeller comprises sets of rods which project from a chain drive to advance the carcasses. In another embodiment the impeller comprises paddles which project from a drive shaft which extends transversely above the tank.

The appts. washes and chills poultry to a predetermined temp. The impeller provides positive movement to the carcasses and thus ensures a uniform residency in the tank. 17.11.76 as 047904 (8pp295)

Salted fish egg prepn. - involves immersing fish egg in aq. soln. contg. vitamin/e, organic acid and protein hydrolysate
TANABE SEIYAKU KK 21.04.78-JA-048020
(01.11.79) A23b-04/02 A23l-01/32

In the prepn. of salted fish egg, the fish egg is immersed in an aq. soln. contg. vitamin E, organic acid and hydrolysate of protein. The organic acid is used in an amt. of 0.1-1 wt. pt. relative to 1 wt. pt. of vitamin E, and the hydrolysate of protein is used in an amt. of 1-10 wt. %. The salted fish egg has clear colour. The organic acid includes malic, citric, ascorbic acid, etc., or their sodium salts. The hydrolysate of protein includes acid or enzymatic hydrolysate of gelatin, which has molecular wt. of about 500-5000. The three components are dispersed in water and desirably dextrin, etc. is added. Fish egg is immersed in the compsn. together with table salt.

In an example, 1 kg of fish egg is washed with water, and 150g of table salt is added. 85 ml of a compsn. contg. 60 mg of red colouring agent, 4.2 mg of yellow colouring agent, 1 mg of a mixt. of vitamin E, citric acid and gelatin hydrolysate of MW of 2000 (5:1:5) and 85 ml of water is then added, followed by standing for 4 hrs. 21.4.78 as 048020 (4pp22)

Cheese prodn. - using ultrafiltration permeate for acidification after cation removal, of the milk

MEGGLE MILCHIND GMB 29.05.78-DT-823339

(06.12.79) A23c-19/02

Prod'n. of cheese comprises ultrafiltration of milk, of reduced pH to give a retentate which, opt. after adding other milk components such as cream, is thickened or coagulated, then processed conventionally to cheese. Novelty is that the permeate from ultrafiltration is acidified by cation removal (pref. to pH 1-2) and then used for reducing pH of the milk.

Pref. the milk is acidified to between pH 6 and the coagulation point of casein. Opt. only a portion of the permeate is acidified, then added to untreated permeate to give the required final pH. Ultrafiltration is pref. controlled to give vol. ratio permeate:retentate of 1.5-3:1.

Process does not require additional, non-milk acids or fermentative pre-ripening. It is easily controlled to give the required characteristics (taste and consistency) of a wide range of cheese types.

Both the milk used for cheese making and the permeate may be used in conc. form. Acidification is esp. by treatment with a cation exchanger or by electrodialysis.

Test unit for simplified testing of biological fluids - to determine antibiotics and sulpha drugs

GIST-BROCADES NV 05.06.78-NL-006086

B04 R16 (12.12.79) G01n-33/16

D/S: E(BE, CH, DT, FR, GB, IT, LU, NL, SW).

Antibiotic and sulpha drug residues in biological fluids are determined by using a unit prep. as follows. Spores of a micro-organism having broad sensitivity for the drugs are introduced into an agar soln. opt. contg. buffer and in such a way that they cannot germinate (lack of

nutrients and/or low temp.) but stay alive. The amt. of spores used is sufficient so that growth occurs in a short time under favourable conditions so that it can be observed by using an indicator.

The sensitivity for sulpha drugs is increased by addn. of trimethoprim but growth rate is not affected. Then the agar soln. is allowed to solidify, and the indicator is added to the agar soln. or to nutrients if prep. separately.

The units are useful for simplified testing of milk, meat prods., serum, urine etc. in a quick procedure giving a result within a few hours and which does not require highly skilled operators to perform it.

Powder for stabilising and enhancing quality of dairy prods. - contg.

1,4-glucan, carbohydrate sweetener and hydrocolloid gum

FMC CORP 02.02.79-US-008672 (31.05.78-US-911658)

(12.12.79) A23g-09/02 A23l-01/04 C08l-01

D/S: E(BE, CH, DT, FR, GB, IT, LU, NL, OE, SW).

Prodn. of water-dispersible powder comprises mixing, in a wet state, disintegrated β-1,4-glucan (I), a carbohydrate sweetener (II) and a hydrocolloid gum (III), then drying the mixt.

Pref. (II) is a hydrolyzed cereal solid and (III) is xanthan or xanthan gum. Pref. compsns. contain 30-80% (I), 10-65% (II) and 5-20% (III), all by wt. of the powder.

The powder is used for stabilizing and enhancing the body and texture of frozen dairy prods. such as ice-cream, ice milk or yoghurt. It is as effective as compsns. contg. carboxymethylcellulose derivs. (which are not permitted in some countries).

Fermented milk prepn. - using Lactobacillus bacteria strain for maintaining constant acidity

SNOW BRAND MILK PRODUCTS 09.06.76-JA-067228
(D16) (19.11.79) *J52151-761 A23c-09/12

Lactic acid fermentation is carried out in animal milk medium contg. fermentable sugar using a variety M13 strain, which is the variety of Lactobacillus jugurti and is made lactose-unfermentable by the artificial treatment. By the invented method the fermented milk (e.g. yoghurt and starting material for lactic acid bacteria drink of which acidity can be kept constant, can be prepd. and the count of living bacteria does not decrease during preservation.

The prepn. of fermented milk using lactose-fermentable bacteria produces increased acidity during presrvation, and the deterioration in taste and flavour and decrease in the count of living bacteria have been observed.

By the invented method M13 strain cannot ferment lactose but can ferment glucose, galactose and mannose, which are previously added to the milk medium.

Glucose and galactose can be formed in the milk medium by previously treating the milk medium with lactase to hydrolyse lactose partly. The variety can be obtd. by treating L. jugurti with N-methyl-N'-nitro-N-nitroguanidine (NTG) M13 strain is trusted to Institute for Microbial industry (FERM P 3574). 9.6.76 as 067228, A23c-9/12 (19.11.79) SNOW BRAND MILK PRODUCTS (8pp) (J5 2151761)

 iron-supplemented raw fish diet for esp mink - iron chelated to
 glutamic acid or RNA to prevent anaemia and kit mortality and
 improve fur quality
ENDER F 20.12.71-NO-004717 (19.12.72-SU-862195)
 C03 (28.03.79) *US3911-117 A23k-01/18
 The quality of mink fur is improved by adding to the food
 a complex cpd. of iron with desoxyribonucleic acid or
 glutamic acid.

This method is esp. effective when the minks are fed
 with raw fish. Apart from the fur improvement the above
 additive prevents the development of the anaemia in
 minks.

The above complex cpds. eliminate the undesired oxid-
 ising action of trimethylamine oxide in the blood, and pre-
 vent the formation of insoluble iron cpds. (which causes
 anaemia).

Fruit peeling cutter - with knife rotating within lightweight guard on
knife shaft housing
ATLAS PACIFIC ENG 15.11.77-US-851640
(04.12.79) A23n-07

A cutter, e.g. for peeling pears, includes a shaft within a
housing and extending outwardly to carry a rotary knife
and chip breaker with a guard mounted on the housing co-
operating to adjust the depth of cut. The guard is partly or
wholly of plastics and has a guard rim around a flat part,
the rim being arcuate and extending towards the cutter to
follow closely an odd shaped part of a fruit.

A projection extending upwardly from the flat part fits
snugly in the housing to prevent rotation of the guard rela-
tive to the housing. The projection has a through bore re-
ceiving the shaft to form a bearing supporting the shaft
within the housing. The cutter is lightweight and requires
less pressure so that less flesh is removed during peeling.

Multipurpose kitchen appliance with high and low speed spindles -
accepting alternate pairs of food mixing paddles
SUNBEAM CORP 19.07.78-US-925735
(04.12.79) B01f-07/32

A kitchen appliance includes a motor within a housing
which drives a gear train in a portion of the housing which
extends above a mixing bowl. The gear train has two
branches each of which drives a pair of contrarotating
spindles; but each of these pairs is driven at a different
speed.

A pair of food-mixing elements can be inserted into
either pair of spindles and these extend into the food mix-
ing bowl. An interlock prevents mixing elements being in-
serted simultaneously into both pairs of spindles. Pref.
one set of mixing elements is a pair of dough hooks and
may be inserted in the low speed spindles. Alternatively
beaters may be inserted into the high speed spindles.

The appliance is used in a kitchen to mix food at either
low or high speeds. The different speeds are provided by
different gear chains from a single speed motor, thus pro-
viding high torque at low speed for mixing dough. 19.7.78

Aq. concentrate for cleansing foodstuffs of animal or veg-
etable origin, comprises (a) 0.1-10 wt.% of water-soluble
to water-dispersible proteins, (b) 0.01-3 wt.% of water-
soluble polymers of mol. wt. $\geq 10,000$, (c) 1-15 wt.% of
water-soluble sequestering agent, (d) 0.01-1 wt.% of water-
soluble food preservatives, (e) 0-0.5 wt.% of food col-
ours and odorants, and (f) the balance to 100% water.

Pref. the proteins are native proteins esp. from pro-
tein-contg. seeds. Pref. polymers are PVA, PVP, and
cellulose ethers. Pref. sequestering agents are alkali
metal salts of an acid selected from citric, lactic, tar-
taric, aminocarboxylic and (poly)phosphoric acids.

The centrare effectively removes the foreign matter
without affecting the taste and aroma of the washed food-
stuff. 3.10.78 as 948221 (4pp924)

D15: WATER TREATMENT

TIIC- ★ D15 89434B/50 ★ BE -878-136
Treating water to remove cyanide(s) and cyanate(s) - using ozone-
contg. gas esp. in two or more zones
TII CORP 08.08.78-US-931958
(03.12.79) C02c

The process comprises (a) introducing the water into an
ozone contacting zone; (b) mixing by stirring at least a
part of the water with an ozone contg. gas and injecting
this into the zone and (c) withdrawing the water with redu-
ced cyanide content.

Pref. process also comprises (d) combining at least a
part of the exit water with the water to be treated and re-
peating stages (a)-(c). Pref. process comprises, using
two contact zones with the ozone contg. gas being contac-
ted with the 2nd zone first then recycled to the 1st zone,
esp. with mixing of the ozone gas to a part of the exit curr-
-ent from the 1st zone.

The process enables economic elimination of up to 90%
or more of cyanates which has hitherto been too costly on
an industrial scale. The cyanates may be formed in the
treatment of the cyanides. 7.8.79 as 878136 (71pp597)

Sec. bacteriological sludge disposal in paper mills - by burning with
waste pulping liquor in chemical recovery furnace
AMOS PT 13.06.74-US-479190
F09 (27.11.79) D21c-11/12

Disposal of sludge, contg. water from prim. effluent
treatment, in a celluloseprocessing plant comprises burn-
ing it with waste pulping liquor in a chemical recovery
furnace, opt. with an auxiliary fuel to assist burning.

The sludge may be conc. before burning and then mixed
with a plant process stream, esp. a thin or conc. pulp
washing or extrn. liquor, and the mixt. opt. further conc.
before passing to the furnace. The sludge may also be
mixed with sewage solids before burning.

The sludge can be used to generate steam or power
from the plant without needing to build a separate inciner-
ator. Chemicals, e.g. SO₂, MgO, CaO or Na₂O, may be re-
covered for reuse in cooking liquors. 13.3.75 as 221990

Transition elements of variable valency are recovered from waste water with simultaneous purification of the waste water. The valency of the transition elements is reduced by a short circuited electrode system of two materials, one of which is less noble than hydrogen and the other more noble than hydrogen. Before reduction there is added to the water a cpd. (I) of an element different from the cathode and more electropositive than the anode material. After reduction complete pptn. of the transition elements can be accomplished e.g. with $\text{Ca}(\text{OH})_2$. Cpd. (I) is pref. silver sulphate. The electrodes are pref. of copper and iron granules. 23.3.77 as 712848 (4pp068).

REZN/ D15 12211B/07 = DS 2735-055
Thermoelectric breakdown of water - using electrolytic cell with DC supply in which the anode and cathode are sepd. by insulation shield

REZNIK S 03.08.77-DT-735055

E36 J03 (06.12.79) *DT2735-055 C25b-01/04

Electrolytic splitting of water, the conductivity of which may be increased by addn. of electrolyte, is effected in a cell contg. at least one anode and at least one cathode and the electrodes are sepd. by an insulator preventing current flow. The cell is operated at a voltage of 15-1000 volts (30-70 volts) and a current density of 0.001-100 (0.1-5) amps/dm².

Sea water is pref. used. The insulator may be of glass. A mixt. of oxygen and hydrogen may be removed from the cathode. 3.8.77 as 735055 (6pp068).

BOHN/★ D15 89466B/50 ★DS 2838-204
Activated sludge tank aeration system - with one link of parallelogram linkage for distributor adjustable in length enabling it to be swung vertically for maintenance

BOHNKE B 01.09.78-DT-838204

(06.12.79) C02c-01/12

The aeration mechanism for tanks in which sewage is treated by the activated sludge system consists of two parallel levers which are mounted on stands and support an air distributor structure at the other end, forming with it a parallelogram linkage. In the working position, the levers are inclined at an angle and the distributor lies horizontally near the bottom of the tank. One of the levers can be lengthened so that in the raised position the distributor can be swung vertical for maintenance.

The horizontal dipping operation reduces the risk of stoppage of the distributor perforations. The swinging action facilitates the maintenance operations. 1.9.78 as 838204 Div. in 2857044 (5pp39).

STEL-★ D15 89492B/50 ★DT 2823-515
Gasifier or aerator for liquid tank - has vertical shaft with impeller at bottom and cone above impeller

FA STELZER E 30.05.78-DT-823515

(06.12.79) B01f-05/02 C02c-01/06

A gasifying or aeration appts. comprises a drive motor mounted above the liquid surface, with a shaft passing down from the rotor vertically through a suction pipe and carrying at its lower end a disc-type impeller with blades on its upper face. This impeller is just below the lower end of the suction pipe and the overall dia. of the blades is slightly greater than that of the pipe.

At the connecting region between the drive shaft and the impeller is a downwardly diverging (typically conical) gas guide block, which is pref. secured to the drive shaft and/or to the impeller. This guide block pref. projects with its lower end beyond the bottom of the suction pipe.

The effect of the gas guide block is to ensure that the air or gas is fed to the impeller in a narrow annular region where the impeller speed is uniform. This results in highly effective breaking up of the gas bubbles and thorough mixing with the liquid in the tank. 30.5.78 as 823515 (12pp236)

MAIH ★ D15 89502B/50 ★DT 2823-587
 Determining organic carbon content of salty water - by
 photochemical oxidn. after dilution with salt free water
 MAIHAK H AG 30.05.78-DT-823587
 J04 R16 (06.12.79) G01n-33/18

Determination of organic C in water contg. much salt and
 organic substances comprises irradiating the sample with
 UV light until all the organic substances have been photo-
 chemically oxidised to CO₂. The amt. of CO₂ prod. is then
 measured. Improvement is that each test sample is dilut-
 ed before irradiation with a salt- and C-free reaction wat-
 er.

Pref. the diluted sample is treated with O₂-contg. gas
 (contg. no CO₂) esp. air, to remove inorganic C before irr-
 adiation. The same gas stream serves as a carrier for
 removal of photochemically-generated CO₂. An appts. for
 this process is also claimed.

The analysis can be done continuously, and fully autom-
 atically, without progressive increase in the salt content
 of the diluent, so encrustation of the equipment with salt
 is prevented. 30.5.78 as 823587 (14pp1251)

STEN/ ★ D15 89517B/50 ★DT 2823-763
 Sewage denitrification - using filter-isolated nitrification and
 denitrification tanks with immerse and drain mechanisms
 STENGELIN V 31.05.78-DT-823763
 (06.12.79) C02c-01/02

Rotary immersion and drip mechanisms are used in a bio-
 logical purification stage for the removal of organic carbon
 from waste waters. These work in the conventional mann-
 er with the growing surfaces which are rotated, immersed
 half-way at least, in the liquid. Two mechanisms are used
 sep. from each other and are positioned, directly or oth-
 erwise, behind the mechanical-biological stage, for the
 oxidn. of the ammonia and the redn. of the nitrates to gas-
 eous N₂.

Used to eliminate residual contamination in the efflu-
 ents, which increases the BOD, when conventional methods
 of electron donation are used. The problems arising are
 solved. 31.5.78 as 823763 (22pp1045)

KRAM/ ★ D15 89528B/50 ★DT 2823-952
 Water purificn. by air injected by wind power - from airscrew on
 mobile mast coupled direct to compressor
 KRAMPITZ J 01.06.78-DT-823952
 (06.12.79) C02c-01/02

A quantity of oxygen which varies over a period of time is
 injected into water to purify the water. The energy of the
 wind is utilised and the feed of oxygen is made to pulsate.
 A screw with vanes is supported by a mast and supplies
 energy for driving a machine, esp. a compressor, which
 is connected to aerating lines laid in the water. The water
 is used as a store for the fluctuating supply of oxygen com-
 ing from the airscrew.

Used for cleaning e.g. ponds, fish ponds and esp. sew-
 age tanks, as well as the water in streams and rivers.
 The device makes is unnecessary to supply energy from
 conventional sources, and uses more efficiently, the sma-
 ller amts. of oxygen which may be provided. 1.6.78 as
 823952 (16pp1045)

MGEI ★ D15 89544B/50 ★DT 2824-204
 Scraper for settling tank mounted on travelling bridge - with
 automatically reversing towing device which also raises and lowers
 scraper
 MASCH H GEIGER 02.06.78-DT-824204
 (06.12.79) B01d-21/18 C02c-01/28

A bottom scraping device for a settling tank comprises a
 transverse bridge which travels along the length of the tank
 and carries a scraper mounted on an arm system so that it
 can be raised for one direction of travel and lowered for
 the other, scraping direction.

The travelling bridge is pulled in either direction by a
 cable, which passes around a drum, rotationally mounted
 on the bridge; while the bridge is being towed, in either
 direction, this drum is rotationally locked by locking elem-
 ents, typically double-armed levers acting as pawls, so
 that the drum acts as the anchor bar for the towing cable.
 2.6.78 as 824204 (14pp236)

VOIJ ★ D15 89567B/50 ★DT 2824-435
 Biological oxygen demand recorder - with oxygen analyser for fish
 basin supplied with effluent side stream
 VOITH J M GMBH 03.06.78-DT-824435
 R16 (06.12.79) A61k-29 G01n-33/18

The activity of fish and shellfish in a basin in which a side
 stream of an effluent is to be checked for toxic components,
 is measured continuously by using a system similar to one
 applied for the oxygen demand of activated sludge. When
 the oxygen concn. in the basin drops below a set threshold,
 fresh oxygen is added to an air stream entering the basin
 and the oxygen flow rate is recorded.

This provides a quantitative reading for the loading of
 surface waters by sewage and other wastes and for the eff-
 ect of any toxic constituents on fish or shell-fish in pisci-
 culture. 3.6.78 as 824435 (9pp39)

DAVY- ★ D15 89568B/50 ★DT 2824-446
 Trickling filter bed for effluent nitrification - with specified size of
 particles and oxygen enriched air in counter flow
 DAVY BAMAG GMBH 03.06.78-DT-824446
 (06.12.79) C02c-01/04 C02c-05/10

A nitrification process for domestic and industrial wastes
 is based on the use of a trickling filter bed. The filter bed
 is filled with particles of 3-10 mm (3-6 mm) size and it is
 accommodated in an enclosed tank which can be backflushed
 by air, water/air or water. The high specific surface area
 results in nitrification at the rate of $\geq 95\%$ in spite of the
 economically favourable small dimensions.

Pref. a distributor sprays the effluent from the inflow
 pipe over the packing of the trickling filter bed. The pipe
 takes away the outflow from the perforated bottom. Oxygen
 -enriched air is circulated through the filter bed in count-
 erflow by blowers or compressors and piping. 3.6.78 as
 824446 (12pp39)

CIBA ★ D15 89640B/50 ★DT 2921-374
 Treating hard water systems contg. suspended solids - with
 phosphorus-contg. acrylic acid telomers, esp. for keeping china clay
 in suspension

CIBA-GEIGY UK 26.05.78-GB-023434

Biological treatment of fluids - flowing through packing unit formed of tilted parallel plates

FISONS LTD 22.07.76-GB-030502
(12.12.79) C02c-01/04

A fluid is biologically treated by causing it to flow over a packing unit in a vessel. The packing unit comprises a series of plates on which bacteria can grow. The plates are inclined at an angle of 5-40° to the overall line of flow of the fluid through the vessel. The plates extend transversely to the line of flow and cover substantially the width of the vessel. Pref. the spacing between adjacent plates is 2-10 cm, and the plates are perforated with apertures having a dia. of 1-20 mm.

The process is used to treat an effluent from the food industry, from distilling or brewing, from textile processing, from a tannery, from a papermaking plant, or from a pharmaceutical or plastics plant. It may also be used to treat domestic sewage or may be used where a hydrocarbon is being purified or a bacterial reaction is being carried out on the fluid in the vessel. By tilting the plates there is a reduced tendency for the passages between the plates to become blocked. 22.7.77 (5pp295)

Cation-exchange activated carbon prodn. - by combining activated carbon having ion exchange gp., obtd. from polyacrylonitrile, with copper or silver

TOHO BESLON KK 22.03.78-JA-031771

A35 E36 J01 P34 (A14) (28.09.79) A611-13 B01j-01/06 C01b-31/08

Cation-exchange activated carbon is produced by combining the activated carbon having an ion-exchange gp. (which is produced from acrylonitrile polymer) with copper or silver by ion-exchange reaction, in which the content of ion-exchange gp. of activated carbon is 0.2 to 3 meq/g.

The activated carbon is used for water treatment of sterilisation water storage tank, breeding water tank and drinking water storage tank. It may also be used in air filters, masks and mats.

In an example, 1 pt. of acrylonitrile copolymer (contg. 90% of acrylonitrile and 10% of methyl acrylate) was mixed with a mixed aq. soln. of 60% zinc chloride and 6.7% sodium chloride so that pure zinc chloride became 4 pts., and the mixt. was calcined at 600°C for 60 mins. without contacting with air. The activated carbon obtd. was immersed in 1N-HCl soln. to remove adhered zinc chloride, washed with water until chlorine ions were not detected and dried. The activated carbon was dispersed in 0.2N aq. cupric nitrate soln., to which 0.1N aq. ammonia soln. was added dropwise until pH of the soln. became 6. Then this was washed with pure water until nitric acid ions were not detected and dried at 120°C. The amt. of copper combined was 63 mg/g. 22.3.78 as 031771 (9pp96)

Solidification of sludge contg. heavy metals and other harmful matter - by mixing with gypsum and sulphur or sulphur cpd.

TORAY ENG KK 28.04.78-JA-050939

E19 L02 M11 (E37) (07.11.79) B01j-01 C02c-03

harmful sludge contg. a large amt. of heavy metals e.g. Pb^{2+} , Cd and Hg etc. and harmful matters, e.g. cyan etc., discharged from plating factory, printing factory and tanning factory etc. is made harmless by adding 50-1,000 wt. % of gypsum and/or gypsum semi-hydrate and 0.1-50 wt. pts. of ≤ 1 sulphur cpd. (or elementary sulphur) collected from colloidal sulphur, water soluble organic sulphur cpds. having mol. wt. $< 1,000$ contg. thiocarbamate, urea or thiol radicals, ferrous sulphate, Na_2S and CaS , 100 wt. pts. of the sludge. This is followed by uniform mixing to solidify the mixt.

Heavy metals or harmful matters are hardly leached from the solidified prod. even after allowing it to stand for long periods in open air or in water. The water content of the sludge is adjusted to 60-90% in the treatment. 27.4.78 as 050939 (3pp34)

BI ★ D15 90460B/50 ★ J5 4142-865
Waste water treatment appts. - used for denitrification of activated sludge contg. waste water by conveying from oxygen rich to oxygen poor zone

KUBOTA KK 27.04.78-JA-050453
(07.11.79) C02c-01/02

The appts. comprises a perpendicular zig-zag formed water path through which the waste water to be treated is circulated. Oxygen-contg. gas is admitted into a descending part of the zig-zag water path from an air pipe to dissolve oxygen under pressure in the water and to form nitrogen oxides by reaction between the dissolved oxygen and nitrogen components in the water. Thus the oxidising zone is formed at the descending part. At least two of the reducing zones are formed at an ascending part of the zig-zag path, at which nitrogen oxides and MeOH of activated sludge are reacted to form N_2 by the action of which the recirculation of the water is accelerated. Gas-drainage pipes are provided at the top of the ascending part, through which N_2 gas is taken-out together with a portion of the waste water to release N_2 gas in the open air, and to recycle the water to the zig-zag path. 27.4.78 as 050453 (3pp34)

Prepn. of drinking water from sea water by evaporation - using evaporation plate onto which water is sprayed, contained in modular housing
SALINON LTD 22.05.78-NL-005535
(26.11.79) B01d-01/16 C02b-01/06

A liq. esp. sea water, is purified by spraying it onto a hot plate and condensing the vapour to give a product which, in the case of water, is suitable for human consumption.

The installation comprises a housing, pref. pyramid shaped with a cross section increasing downwards with a feed pipe for the fluid to be cleaned discharging over a heated evaporation plate. The housing is pref. from 1.5-2.5 m high and the angle of inclination of the walls is such that the vapour condenses on the walls and flows down them to a collection outlet at the lowest point.

The device is a compact unit with a high yield capable of being built up in parallel banks to an installation of any desired capacity. 22.5.78 as 005535 (12pp1370)

Sludge drier using recycled prod. as fuel - used to produce granular fertiliser prods. or for total incineration requiring no additional fuel
VAN DEN BROEK ENG B 25.05.78-NL-005709
(27.11.79) C02c-03 C07f-03/06

Effluent sludge is dewatered, dried and incinerated in a process which offers an alternative to the usual prodn. of fertiliser when there is either too much fertiliser available or the metal content in the end prod. would be too high. The sludge is passed through a mechanical dewatering installation and into a drying drum. A part of the end prod. is recycled via a mechanical handling system and bunkers into the oven for providing the drying heat for the process.

Opt. the entire prod. can be recycled in this manner and incinerated. If the oven is equipped with a moving grate, the dried prod. is fed onto the grate from the bunker via a suitable feed valve. If the furnace is equipped with a pulverised fuel burning system, additional grinding equipment is incorporated to reduce the granule size to that required by the burners.

The system operates without additional fuel and can be used for the complete disposal of the sludge if that is required. 25.5.78 as 005709 (10pp1370)

WAFI- ★ D15 90543B/50 ★NL7809-661
Drinking water prepn. from sea water by membrane filtration - in which the sea water is fed directly into first stage filter without chemical pretreatment
WAFILIN BV 22.09.78-NL-009661
(30.11.79) B01d-13 C02b-01/82

Drinking water is produced from seawater by means of membrane filtration in which the permeate from a first membrane filter unit is fed into the second membrane filter, the permeate from the second filter having a salt concn. less than that tolerated for drinking water. The seawater is fed directly into the first membrane filter via a coarse filter whose function is to remove large objects which might damage the equipment.

The arrangement is pref. such that the salt concn. in the permeate from the first stage is $< 60\%$ of that in the seawater itself. The pref. conditions for the filtration steps are 20-28 atmospheres for the second stage, 40-45 atmospheres for the first stage and surface area in the filter to concn. volume ratios of $< 100 \text{ m}^2/\text{m}^3$ in the first membrane and 10-50 m^2/m^3 in the second filter.

Feeding the seawater direct into the first filter eliminates the traditional chemical pretreatment stage thereby reducing the overall size of the installation. 22.9.78 as 009661 (13pp1370)

Filtration membranes esp. of cellulose acetate - made by casting a polymer soln. contg. a water miscible solvent and successive coagulation in cold and warmer aq. baths
WAFILIN BV 29.12.78-NL-012664
A88 J01 (A11) (30.11.79) B01d-13/04

Dry-storable membranes for membrane filtration are made by casting a film from a soln. of a macromolecular material in a solvent system contg. a water-miscible solvent. The cast film is then immersed successively in a first aq. liq. at a temp. of $< 10^\circ\text{C}$, then in a second aq. liq. at a temp. of $> 20^\circ\text{C}$.

The process is esp. useful for making cellulose acetate membranes which are less brittle in the dry state than known membranes, and are thus easier to handle. The coagulation bath is operated at lower temps. than in known

processes, which represents a saving in energy. The resulting membranes have a very high salt retention capacity coupled with satisfactory flux. 29.12.78 as 012664 (8pp513)

Waste water biochemical purification quality control - by estimation of dehydrogenase activity of water mixed with sludge in presence of triphenyl tetrazolium chloride, for aeration control

BAKINSK VODGEO RES 17.12.76-SU-431436

(28.02.79) C02c-01/02

Quality control of water purified by aeration is carried out by comparison of the dehydrogenase activity of mixts. with sludge at 35-37°C in presence of triphenyltetrazole chloride as indicator, the level of purification being estimated from the colour of the samples.

The method can be simplified and speeded up, and its range of use widened, if the comparison is made between the sludge mixt. itself and the sludge mixt. with addn. of 1-2% of uncleaned waste, instead of between 3 samples as before, i.e. the sludge, the sludge with addn. of untreated water, and sludge with addn. of tap water. The amt. of untreated water added is determined from the BOI

2% being added for a BOD of 500 mg/l and 1% for a BOD of 500 mg/l. The amt. used is 1.5-2 times less than in the previous method. Conventional analysis confirms that the redn. in BOD correlates with the colour of the sample to 97-99%.

Aerobic compost fermentation from organic sludge - by traversing stirrer mechanism and top layer skimming conveyors in aeration tank

NIIGATA ENG KK (SEIU) 13.08.75-JA-098239
(30.03.79) *DT2636-535 C05f-03/06

Organic sludge, such as a mixt. of caeces and urine from animal farms, is turned into compost in an aerobic fermentation tank. This has a stirring device which introduces the sludge through a hollow shaft and agitates the sludge as it traverses on a bridge on top of the tank in both directions.

Aerators at the bottom introduce air bubbles. A conveyor system of horizontal and inclined screw conveyors

also mounted on the bridge, skims off a layer of compost from the top and discharges it to a belt conveyor outside.

This effects an aerobic fermentation even when the sludge is heaped to a thickness of one metre or more. A single tank combines all functions of stirring, mixing, aerobic fermentation and drying.

Polluted water analyser intake strainer - with stack of perforated discs and blades permitting controlled leakage to analyser
HACH CHEMICAL CO 03.03.78-US-883205
J01 (04.12.79) B01d-33

The strainer comprises a frame with two posts supporting an end plate, and perforated discs slidable but non-rotatable on a shaft journaled for rotation in the frame. Blades sandwiched between the discs are not coupled to the shaft but are slidable on the posts.

The disc-blade stack is urged against the end plate completely enclosing the perforations, and the shaft is slowly and continuously driven. The plate has a passage opening

to the perforations, and a post passage opens to the plate passage so that water leaking between discs and blades passes to a tube while particles are stopped at the disc peripheries. 3.3.78 as 883205 (4pp1358)

ASAH D15 30455A/17 =US 4177-150
Porous polyacrylonitrile membranes with compact skins - by extruding polymer soln. into coagulation bath and treating film in hot water etc., useful as battery separators and osmosis membranes
ASAHI KASEI KOGYO 08.09.76-JA-106613
A14 J01 L03 R47 +P73 (A32 A85 D16) (04.12.79) *DT2740-252
B01d-13/04

A dried porous membrane having a porosity of 20-70 vol.% and a fragility of <30 , is composed of acrylonitrile polymer walls sepg. predominantly interconnecting small size pores. The membrane comprises surface layers integral with a support layer to form a single continuous acrylonitrile polymer phase. Each of the surface layers has pores of 0.001-0.05 μ in average size and a thickness of 0.1-20 μ . The support layer has pores of a larger average size than those in the surface layers.

Membrane has improved flexibility, folding endurance and impact strength. It is used as a separator in lead storage batteries. 6.9.77 as 831017 (18pp997)

SUNO ★ D15 91068B/50 ★US 4177-222
Semipermeable membrane comprising block copolymer of poly(di:oxa:amide) - and a melt spinnable polyamide contg. no ether gps.

SUNTECH INC 19.01.79-US-004777 (14.11.73-US-418524)
A23 J01 (A88) (04.12.79) C08I-77

A novel block copolymer has a mol. wt. of 5,000-100,000 and a repeat structure of formula (I):

(where $\text{R}_1, \text{R}_2, \text{R}_3$ are each H, 1-10C alkyl or 3-10C isoalkyl; R_4 and R_5 are each 1-10C alkylene or 3-10C isoalkylene or R_5 is a direct bond; Z is derived from a melt spinnable polyamide; y and z are each 4-200; the polyamide is nylon-6, -6,10, -6,6 or -11, or MXD-6, or PACM-9, -10 or -12). The copolymer is pref. hydrophilic.

The copolymer is used as a semipermeable membrane, and is processed easily, has good mechanical properties, and stability. 19.1.79 as 004777 C.i.p. 4130602

GRAC ★ D16 89435B/50 ★BE-878-137
Enzymatic diagnostic compsns. - comprising hexokinase and glucose-6-phosphate dehydrogenase immobilised on carboxylated polyurea urethane support

GRACE W R CO 07.08.78-US-931334
A96 B04 R16 (A25) (03.12.79) G01n

A diagnostic compsn. comprises a mixt. of hexokinase (HK) and glucose-6-phosphate dehydrogenase (G-6-PDH) immobilised in biologically active form on ≥ 1 external surface of a support comprising a carboxylated poly(urea-urethane) with skeletal segments of oxyalkylene units, of which ≥ 60 mole % are oxyethylene.

A process for analysing human body fluids, comprising contacting an aq. soln. of the body fluid with the immobilised enzymes to catalyse the reaction between the components of the solns. and determining the amt. of ≥ 1 component in the resulting soln. A process for immobilising enzymes, comprising reacting an amino acid with excess urethane prepolymer, polymerising the resulting carboxylated prepolymer, and condensing an enzyme with the prod. in the presence of a carbodiimide.

The immobilised KH/G-6-PDH mixt. can be used to determine ATP, ADP, creatine phosphate, glucose, glucose-6-phosphate, NAD, NAD phosphate, glucose-1-phosphate, fructose-6-phosphate, myokinase, phosphoglucose isomerase, galactokinase or creatine phosphokinase.

Inhibiting growth of bacteria in fungal culture media - by adding sugar and quinone or hemi:quinone deriv.

MYCOGEL LABS INC 01.04.75-CH-004112
B04 C03 (B02 B05) (30.11.79) C12k-01/06

Agent for inhibiting the growth of bacteria in culture media used for growing fungi and yeasts (excluding agents described in CH 505900) comprises (a) ≥ 1 sugar and (b) a quinone of formula (I) or a hemiquinone of formula (II).

In the formulae $n=0-4$; each R is a substit. or 2 adjacent R complete a condensed ring. A completes a condensed carbocyclic or heterocyclic ring; $m=0-3$ and each R' is a substit. or 2 adjacent R'

complete another condensed homocyclic or heterocyclic ring. Alternatively a glycoside of (I) or (II) is used.

Used in media to isolate, identify or cultivate fungi, esp. for clinical diagnosis of Candidiasis. Unlike the polyhydroxyanthraquinones proposed in CH 505900 these additives do not require exact pH control; generate fungal colonies of characteristic colour or form; stimulate growth of many strains (e.g. *Aspergillus niger*) and enhance prodn. of metabolites such as citric acid or antibiotics. 1.4.75 as 004112 (7pp1251)

Softening tough parts of mushrooms - by incubating in acidic salt soln. opt. with addition of enzymes

SCHMITZ H 05.06.78-DT-824553
(D13) (06.12.79) A231-01/28

Prodn. of soft, edible fungal fruiting bodies (or their parts) from tough fungal material, rich in softening enzymes, comprises treating the material with an acid soln. of pH 3-5.5 and salt conc. 0.02-0.5 M at 20-55°C for 0.5-10 days. The treatment may be under aerobic or anaerobic conditions.

Pref. the acid soln. is a pH 4 acetic, citric or lactic acid buffer, or an acid whey made by fermentative milk acidification. The fungal material may be fresh or stored for up to 2 years at -2° to -40°C.

A similar process can be used with fungal material of low softening enzyme content if combined with treatment with glucanase and chitinase (supplied e.g. as an extract of enzyme-rich fungi).

For treating the tough stems of *Pleurotus* species (esp. *P. ostreatus*) which represent 20-25% of the total crop and are usually discarded. The prods. have acceptable consistency, good taste and aroma, and can be stored frozen for a long time. 5.6.78 as 824553 (20pp1451)

Isomerised hop extract prodn. - by heating in non aq. medium with alkali, then extn. with water

BUSH BOAKE ALLEN 31.05.78-GB-025212
(06.12.79) C12c-09/02

Prepn. of isomerised hop extract comprises treating a hop extract contg. α -acid (or its soln. in a non aq., water-immiscible solvent) with a non-aq. alkali. The resulting non-aq. resin-contg. alkali metal salt of α -acid (or its soln.) is then heated to give a salt of iso- α -acid. This is recovered by partitioning between a water-immiscible apolar solvent and water with pH 8.2-9.5.

Pref. a solid alkali is used, esp. Na or K hydroxide or carbonate, best K_2CO_3 . Pref. >100% of the stoichiometric amt. of alkali based on total acids with $pK \geq$ that of α -acid is used, esp. >140% on α -acid.

The prod. is used as a bitter agent for beer. The prod. is obtd. completely free of β -acid by a simple extraction procedure. Less liq. is needed so throughput is high and less base compared with isomerisation in aq. media. 23.8.78 as 836823 (24pp1251)

ICIL ★ D16 89599B/50 ★DT 2912-110
Compsn. contg. indigo and xanthan polysaccharide - made by carbohydrate fermentation using *Xanthomonas campestris*, giving homogeneous storage stable dispersions

IMPERIAL CHEM INDS LTD 31.05.78-GB-025661
A60 E24 F06 (06.12.79) C09b-07 C09b-67 D06p-01/48

Compsn. comprises indigo (I) and a natural xanthan polysaccharide (II) obtd. by fermenting carbohydrates with *Xanthomonas campestris*. Dispersions of this comps. in aq. or water-miscible organic media are also new. Pref. the dispersions are aq. and contain 10-30wt. % (on total) of (I) and 0.1-10wt. % (on (I)) of (II). Opt. they also contain up to 10wt. % (on total) of an antifreeze.

Dispersions are convenient in dyeing since they are easily handled, homogeneous and of good storage stability,

and avoid problems associated with handling dry (I). 27.3.79 as 912110 (8pp1251)

CHUS ★ D16 89657B/50 ★DT 2921-82
Antitumour compns. contg. bacterial cells - of *Streptococcus equisimilis*

CHUGAI SEIYAKU KK 29.05.78-JA-063418
B04 (06.12.79) A61k-35/74 C12k-03

Compsns. for treating malignant tumours contain cells of *Streptococcus equisimilis* (esp. ATCC 21597). The compns. are pref. prepd. by (a) heating a suspension of the cells in a salt soln. contg. ≥ 25000 (esp. 26000-60000) U/ml of a penicillin at 30-38°C for 10-30 min and then at 40-50°C for 20-40 min, or (b) heating a suspension of the cells in a salt soln. at 65-100°C for 5-30 min. The salt soln. is pref. Bernheimer's basal medium (BBM) or phosphate-buffered physiological saline soln. The compns. are pref. stored in freeze-dried form with a stabiliser comprising an amino acid, a sugar, dextran or soluble starch.

Compsns. have higher activity than analogous compns. contg. *S. haemolyticus*, e.g. giving 48-89% inhibition of a wide range of tumours in mice. 29.5.79 as 921829 (17pp367)

FUJI ★ D16 89715B/50 ★EP ---5-751
Stable and potent hyaluronidase BMP-8231 - obtd. by cultivation of *Streptomyces koganeiensis* atcc 31394 in nutrient medium

FUJISAWA PHARM KK 11.05.78-JA-056313
B04 C03 (12.12.79) C07g-07/02 C12d-13/10

D/S: E(BE, CH, DT, FR, GB, IT, NL, OE, SW).

Hyaluronidase BMP-8231 (I) is new. It has endo- β -hexosaminidase type action and it degrades hyaluronic acid, but not chondroitin or chondroitin sulphate A or C. It acts at an optimum pH of 4.0, and it is stable at pH 4-11.3. It is effective at an optimum temp. of 60°C. and is stable at $\leq 60^\circ\text{C}$.

(I) has higher stability, non-susceptibility to proteolytic enzymes and higher enzymatic potency than prior hyaluronidase enzyme preps. It is a spreading factor, diffusing factor etc. for increasing absorption of medicinals and in antibiotic solns., esp. for treating bovine mastitis. It has also been used as an analytical reagent and it may produce significant redn. in myocardial infarct size. 10.5.79 as 101420 (27pp1248).

Crude urokinase purification by adsorption chromatography - on sulpho gp. contg. polysaccharide(s), useful for treating circulatory disorders

TANABE SEIYAKU KK 30.09.77-JA-118321 (09.04.77-JA-040683)

A97 B04 (A11) (12.12.79) *DT2812-609 C07g-07/02

Crude urokinase is purified by contacting an aq. urokinase soln. with a water-insol. hydrophilic polysaccharide having a gp. of formula $-CH_2CH(OH)CH_2R$ (where R is sulpho (thio) or p-sulphophenylamino) to adsorb the urokinase, then eluting the urokinase. Pref. the aq. urokinase soln.

has a specific electric conductivity ≥ 15 m mho/cm, and the elution is carried out by contacting the polysaccharide with an aq. soln. of specific electric conductivity ≤ 20 m mho/cm.

Pref. the aq. soln. used for the elution is a phosphate, carbonate or tris(hydroxymethyl)aminomethane buffer soln. or an aq. NaCl soln. Pref. the aq. urokinase soln. has pH 6-9, and the soln. used for elution has pH 3-9. The urokinase obtd. has high potency and is free of pyrogens. 28.3.78 as 011941 (+28.4.77-JA-049634) (9pp924)

Anticancer agent contg. KS substance - prepd. by cultivating e.g. *Daedalea dickinsii* or *Lentinus edodes* microorganism
KIRIN BREWERY KK 23.03.78-JA-032384
B04 (01.11.79) A61k-35/84 A61k-37/02 C12d-09/04

The anticancer agent contains, as active ingredient, a KS substance having the following physiochemical properties which is an amorphous powder having (1) elementary analysis $18.6 \pm 2.3\%$ C; $2.8 \pm 0.4\%$ H, $1.3 \pm 0.2\%$ N and $10.5 \pm 1.3\%$ ash., (2) mol. wt. 70,000 (Viogel P-series column and Amicon ultrafiltration), (3) decompsn. pt. $\geq 300^\circ\text{C}$, (4) IR spectrum (cm^{-1}) 3350 (valley), 2900 (valley) 1640 (valley), 1480 (small peak), 1400 (valley), 1320 (sharp valley), 1240 (small valley), 1070 (valley), 1030 (valley) and 560 (valley), (5) solubility in water and insolubility in ethanol, n-butanol, acetone and hexane and (6) an aq. soln. pH of 6-7. When used as a 1% aq. soln. it gives a positive result in anthrone and carbazole sulphate colour reactions and a negative result in Elson-Morgan reaction.

Its amino acid compsn. (g/100g) is alginine 0.4 ± 0.05 , lysine 0.5 ± 0.06 , histidine 0.4 ± 0.05 , phenylalanine 0.2 ± 0.03 , leucine 0.3 ± 0.04 , isoleucine 0.3 ± 0.04 , methionine 0.1 ± 0.01 , valine 0.4 ± 0.05 , alanine 0.6 ± 0.08 , glycine 0.8 ± 0.1 , proline 0.6 ± 0.08 , glutamic acid 1.2 ± 0.2 , serine $a \pm 0.1$, threonine 0.8 ± 0.1 , aspartic acid 1 ± 0.1 , tryptophane 0.06 ± 0.01 and cystine 0.3 ± 0.04 . Its sugar compsn. (gas chromatography) is glucose 57.6%, galactose 5.05%, mannose $26 \pm 3\%$, xylose $8 \pm 0.8\%$ and arabinose $5 \pm 0.3\%$.

Although the KS substance does not directly attack cancer cells, it increases the protective functions of living body and indirectly inhibits proliferation of cancer cells.

It is prepd. by cultivating e.g. *Daedalea dickinsii* KSDD 6 (FERM-P No. 3933) or *Lentinus edodes* KSLE 7 (FERM-P No. 3994). 23.3.78 as 032384 (12pp140)

Cultivation of tumour cells producing colony stimulating factor - by first culturing in serum good for cell multiplication, and then a serum bad for multiplication, to give highly multiplying cells

JIKKEN DOBUTSU CHUO 22.04.78-JA-047177
B04 (01.11.79) A61k-35/12 C12d-13 C12k-09

Cultivation of tumour cells producing colony stimulating factor (CSF) comprises first cultivating tumour cells producing CSF effective for human (hCSF) in a medium contg. a serum good for cell multiplication and then keeping the cultivated cells in a medium contg. a serum bad for cell multiplication to bring about transformation into highly multiplying cells. The resulting cells have high capability to produce hCSF and their properties do not change by successive cultivation.

In an example, human submaxillary cancer tissue (LJC-I-JCK) (300 mg) which had been transplanted to a nude mouse and multiplied was isolated, cut into pieces and treated with trypsin. The tissue was cultivated in an F-10 (RTM) medium (16 ml) contg. 10% bovine fetus serum, penicilline (100 $\mu\text{g}/\text{ml}$) and streptomycin (100 $\mu\text{g}/\text{ml}$) at 37°

C for 3 days in 5% CO_2 -95% air. The resulting cell sheet was treated with trypsin and EDTA to prepare a cell float. This was added to an F-10 medium contg. penicilline (100 $\mu\text{g}/\text{ml}$), streptomycin (100 $\mu\text{g}/\text{ml}$) and 10% bovine serum which is bad for cell multiplication and maintained at 37°C in 5% CO_2 -95% air. Growth was poor, but while changing the medium twice a week transformation suddenly took place after 6 months. Thereafter, the cells began vigorous multiplication (double in 18-20 hrs.). 22.4.78 as 047177 (4pp140)

Antibiotic malioxamycin - prepd. by culture of *Streptomyces lydicus* SANKYO KK 20.04.78-JA-047113
B04 (05.11.79) A01n-09 A61k-35/74 C07g-11 C12d-09/14

Malioxamycin having the following properties is new: (1) appearance: colourless needles, (2) m.pt. 158-160°C (with foaming), (3) $[\alpha]_D^{25} = +73.4^\circ$ ($c = 1.21$, water), (4) elementary analysis: found: C 40.36%, H 6.79%, N 10.41%, calculated for $\text{C}_9\text{H}_{18}\text{N}_2\text{O}_6 \cdot \text{H}_2\text{O}$: C 40.60%, H 6.81%, N 10.52%, (5) mol. wt. 348; (6) molecular formula: $\text{C}_9\text{H}_{16}\text{N}_2\text{O}_6$, (7) UV spectrum: end absorption (200 $\mu\text{g}/\text{ml}$ in MeOH), (8) $\text{In}(\text{KBr})(\text{Fig. 1}) \text{ cm}^{-1}$: 3500, 1682, 1625, 1590, 1585, 1510, 1415, 1370, 1320, 1278, 1250, 1201, 1150, 1078, 1053, 1010, 978, 805, (9) NMR in $\text{DMSO}-d_6$: 0.92, (6H), 1.94 (1H), 2.62 (2H), 3.41 (1H), 4.30 (1H) ppm. (10) solubility soluble in water, MeOH, EtOH, Me_2CO , DMSO, DMFA; insoluble in EtOAc, CHCl_3 , Et₂O, PhH, hexane, petroleum ether. (11) colour reaction: positive to ninhydrin and FeCl_3 reactions. (12) TLC: Rf on cellulose 6065 (Eastman-Kodak Co.) = 0.46 ($n\text{-PrOH-PyAcOH-H}_2\text{O} = 15:10:3:10$), 0.47 ($n\text{-BuOH-AcOH-H}_2\text{O} = 3:1:1$).

Malioxamycin has the following antimicrobial spectrum. MIC ($\mu\text{g}/\text{ml}$): *Staphylococcus aureus* FDA 209P JC-1, > 100; *Bacillus subtilis* PCI219, > 100; *Escherichia coli* NIHG JC-2, 100; *E. coli* B, > 100; *E. coli* 665 (resistant strain), 100; *E. coli* SAAK 72375 (resistant strain), 50; *Klebsiella pneumoniae* 846 (resistant strain), 100; *Serratia marcescens* SANK 73060, > 100; *Pseudomonas aeruginosa* 1046, > 100. Toxicity: no unusual condition observed in mouse at a dose of 100 mg/kg (i.v.) over 14 days.

Malioxamycin is produced from *Streptomyces lydicus* No. 15748 (FERM-P 4481), which is isolated from the soil of Biwako lake, Japan. This may be cultured on a conventional medium used in culture of microorganisms of actinomycetes under shaking or aeration and agitation at 20-35°C, pref. 28°C for 7-9 days. 20.4.78 as 047113 (8pp52)

Penicillin acylase/methacrylic polymer complex - stable mechanically and biologically, used in prepn. of high yields of 6-APA from penicillins

BEECHAM GROUP LTD 28.12.73-GB-059978
A14 B02 (28.03.79) *BE-823-782 A61k-31/43 C07d-499/10

Novel water-insoluble enzyme complex comprises a penicillin acylase adsorbed on a water-insoluble polymeric substrate cross-linked with glutaraldehyde, glyoxal or formaldehyde, the novelty being that the substrate is a polymer or copolymer of methacrylic acid. Process for preparing 6-APA comprises contacting an aq. soln. (pH 6.0-9.0) of benzyl penicillin, phenoxypenicillin or their salts with a complex as in (A).

Complexes are stable, and no concurrent neutralisation is required in use.

Preferred substrates are copolymers with divinyl benzene and opt. benzenesulphonyl gp. contg. monomers, esp. "Amberlite IRC-50" and "Zeokarb 227" (RTM). Preferred enzyme is from *E. coli* NCIB 8734. Complexes are prepared by adsorbing the enzyme on the non-crosslinked substrate followed by crosslinking.

MOSU ★ D16 90703B/50 ★SU -654-620
More active immobilised enzymes prepn. - by graft copolymerisation of a polymeric carrier with a monomeric allylamine using ionising radiation in presence of phosphoric acid
MOSCOW LOMONOSOV UNIV 06.12.76-SU-426265
A97 B05 (A18) (30.03.79) C07g-07/02

Immobilized enzymes (I) are widely used in fine organic synthesis, medicine and the food industry. Their prepn. involves graft copolymerisation of a polymeric carrier with a monomer under the action of the ionising irradiation, followed by treatment of the resultant graft copolymer with an activator and a soln. of an enzyme.

The process features use of an allylamine (II) as a monomer, a glutaraldehyde (III) as an activator, the process being carried out in the presence of phosphoric acid (IV) being equal 1:1.0-10. This simplifies the process and increases the activity of (I).

The reaction is generally carried out in bulk, or in polar solvents (water, alcohols, ketones, ethers, esters and other) under the action of ionising irradiation, e.g. γ -radiation (the total irradiation dose for the graft copolymerisation equal $2 \cdot 10^6$ - $5 \cdot 10^6$ rad)- Polymers for grafting (II) include polyethylene, polypropylene, polystyrene, polymers of the diene series etc. The homopolymer is washed away from the graft copolymer with a 5-50% aq. soln. of an inorganic acid, e.g. HCl, H_2SO_4 , H_3PO_4 , and others. Immobilisation of the enzyme on the graft copolymer treated with (III) is carried out by incubation of the said copolymer in the enzyme soln. at the physiological pH values at 0-50 °C.

Animal feed yeast culture medium - contg. cellulose sulphate prodn. waste water purifcn. slime, oxidate and vegetable hydrolysate

LENINGRAD FORESTRY ACAD 01.06.76-SU-367939
C03 (D13) (30.03.79) C12b-03/12 C12c-11/08

The substrate for prodn. of yeast biomass for use as animal feed additive is obtd. by the oxidative decomposition of raw material with subsequent filtration of the resulting oxidate and mixing it with vegetable material hydrolysate. In order to utilise industrial waste materials for yeast growing cellulose sulphate prodn. waste water biological and chemical purifcn. slime is used as starting material. The slime is thermally treated for 30 mins. at 85-90 °C and pH2 prior to oxidation decompn., filtration, mixing with hydrolysate etc.

The oxidn. is carried out at 220 °C for 3 hrs. using air and adding aq. ammonia.

Green algae culture unit - has a heating channel widening in flow direction and featuring a sloping bottom

CENT ASIA NATURAL G 01.08.75-SU-164683

P13 (10.04.79) A01g-31/02

The flue gases of the unit for mass cultivation of green algae are subject to cleaning prior to their admission to the unit. The heating channel is tapered and widens in the flow direction with bottom sloping 5-10°, and the system of channels is in the form of zig-zags. The distributing manifolds are connected to the heating channels by ducts featuring evenly-spaced bubbling tubes.

The combustion prods. are cooled in the gas ducts, the tapered channels reducing their velocity which contri-butes to dust precipitation. The given-up heat raises the temp. of the suspension in the tank, while the accumulate slurry is flowing to the next channel. The cleaned gases enter the bubbling tubes for dispersion in the *Chlorella* suspension.

BIOTECH RES INST 13.12.77-SU-554624

(D17) (08.04.79) B01d-11/04

Horizontal extractor for processing solid materials with

an elastic or fibrous structure and with a tendency towards swelling e.g. the removal of enzymes from the surfaces of fungi nutritive substances from vegetable raw materials (sugar beet, malt extract etc) sugar from cane etc. It comprises a horizontal cylindrical body divided into sections by vertical screens, each section having a discharge opening, a hopper, and a shaft with a scoop disposed coaxially to the body. The scoop is fastened to an arm, and a perforated braking screen is located in front of the discharge opening so that it can rotate. Extraction process effectiveness is increased by reducing the time the liquid remains in the solid phase. This is achieved by making the perforated rotating screen in the form of two plates positioned at an angle to one another. The perforated screen is also fitted with a weight and the angle of the rear wall of the scoop is fixed by providing a fasten for it. Prinspun V. Ya., Zhuchkov V.N., Kraltsov Yu.K., et al. Regulating the supersaturation of boiling sugar solutions - by constantly coupled and compared conductivity and solution levels
SIEMENS AG 28.02.66-DT-567316
(06.12.79) C13g-01/06

A monitor metering the conductivity of the soln. in a secondary boiler regulates the supersaturation by signals put out to the valves controlling the flow of juice and water into the boiler. At the same time a level monitor puts out signals representing the height of the sugar soln. in the boiler; the nominal value of the conductivity supplied to the conductivity monitor being made dependent upon the level of the sugar soln. in the boiler.

Used to overcome the problem that, under unfavourable boiling and vacuum conditions, the conductivity monitor cannot bring deviations from the rule into line with the time schedule, so that, when the time runs out, the vessel is not filled to the max. and the crystal size is unsatisfactory. The present arrangement make possible the continuous determination of the level and of the conductivity, so that the two values are constantly coupled and cannot wander away from each other. 28.2.66 as 567316 (7pp1045)

The outer mantle surface of the drum rotating in the housing of a tobacco fibre feeding machine, has a series of rakes extending across the drum, and offset to each other in the circumferential direction.

The machine which draws a fleece of tobacco through the annular cavity between the drum and the housing, has a feed inlet directed towards the rising section of the drum, and the stack of tobacco presses against this.

The fleece of tobacco held by the rakes is presented to a selected outlet leading to a cigarette making machine, and that part of the fleece which is not passed through the outlet, is taken round by the drum to the inlet so as to be presented to the outlet again.

There are many fewer parts than in existing machines so that wear is reduced to a great extent, and a much more delicate handling of the tobacco fibres is made possible. 25.4.77 as 420028 (6pp1045).

Embossing fibrous sheet for making cigarette filter tips - produces wide range of sheet textures, by adjusting continuous machine

SOC JOB ANC ETAB BARDOU 03.03.78-FR-006140

F07 P15 (02.11.79) A24c-05/50

Process and appts. for impressing a fibrous sheet to a profile of crests and indentations is claimed. This is preparatory to rolling the sheet into a cylindrical stick to be cut into filter tips for cigarettes. During the impressing operation the machine setting is adjustable to vary the

heights of the crests of the profile. This adjustment simultaneously alters the degree of lateral stretch of the sheet as well as its texture. The adjustment is infinitely variable within a range which at one extreme gives a sheet texture which is cleanly embossed, corrugated etc., and at the other extreme gives a texture of crinkles and creases through out the length of the sheet.

The impressing machine pref. employs a pair of rolls on parallel axes. Each roll has a surface profile of coaxial, annular grooves and crests and the crests of each roller engage to an adjustable depth in the grooves of the other roller. This adjustment is pref. achieved by having a fixed axis roll opposed to a roll on an adjustable axis.

Used for producing filter material for cigarette filter tips. A single machine can be used to produce a wide range of textures of filter sheet. Adjustment within the range is infinitely variable and can be effected during continuous operation of the machine. 3.3.78 as 006140 (13pp448)

Fur skins treatment unit - includes a perforated chute inside the conical shell of reversibly driven partitioned drum
TATARSK FUR COMBINE 06.08.76-SU-395390
(30.03.79) C14b-01 C14b-15

Improved working conditions and efficiency of the unit handling fur skins are due to the discharge chute featuring perforations, and fitted inside the conical shell. Discharge ports are made in the end of the drum and in one section of the conical shell. The partitions of the said section are perforated.

The drum is reversibly turned to prevent fur skins rolling-up, and the perforated partitions ensure stirring of the load. The skins raised to the top with some treatment liquid drop from the sloping surface of the shell, the process repeated many times. The skins fall on the inclined perforated chute for discharge to the conveying carriage.

A97 E19 (01.11.79) A61k-07/06

Hair-treating compsn. contains ≥ 1 quat. ammonium salt having a carboxylic acid gp. as anion. Pref. the agent also contains the reaction prod. formed between ≥ 1 quat. ammonium salt (II) with 0.2-20 times in mol. on (II) of $\geq 6-30\text{C}$ carboxylic acid (salt) in aq. medium.

In the formulae, R_{1-4} are alkyl, alkenyl, benzyl, monohydroxy-alkyl or polyoxyalkylene gp. $-(\text{CHR}'\text{CH}_2\text{O})_m\text{H}$. R' is H or methyl. m is 1-100. One or two R_{1-4} should be 14-30C alkyl, alkenyl, monohydroxyalkyl gp. or the polyoxypropylene gp., of which R' is methyl and m is 30-100 and remainings should be 1-3C alkyl, monohydroxyalkyl gp., benzyl or the polyoxyethylene gp., of which R' is H and m is 1-30. $\text{R} - (\text{COO}^-)_n$ is a 6-30C carboxylic acid gp. which has ≥ 1 carboxyl gp., n is the number of carboxyl gps. included in the carboxylic acid. X is halogen, mineral acid ion such as H_2PO_4^- or lower alkylsulfate ion such as $\text{CH}_3\text{OSO}_4^-$, $\text{C}_2\text{H}_5\text{OSO}_4^-$, etc.

Both water soluble and difficultly water soluble quaternary ammonium salt with carboxylate ion show excellent conditioning effect and emollient effect for hair. Further water insoluble quat. ammonium salt is less irritating to the skin and eyes than the water soluble salt. Thus by

combining the water difficult soluble quat. ammonium salt (I) excellent safe hair-treating compsn. can be obtd. 25.4.78 as 048921 (8pp5)

SHIS ★ D21 90069B/50 ★ J5 4140-739
Pretreating compsn. for hair dyeing - contains cysteine and/or its ester(s) and an organic alcohol solvent as promoter
SHISEIDO KK 25.04.78-JA-048920
E17 (01.11.79) A61k-07/13

Pretreating agent contains 0.5-10 (1-8) w/w% of ≥ 1 cpd. of formula (I) (where X is H or $-\text{COCH}_3$; Y is H or 1-4C alkyl) as the major ingredient and opt. 1-50 (10-30) w/w% of ≥ 1 organic solvent selected from ethanol, i-propanol and n-propanol as the promoting agent.

(I) By treating hair with the pretreating agent the S-S bond in hair keratin can be partly opened and as the result dye molecules can be easily impregnated and diffused in hair.

Hair can be dyed excellently with direct dyes at low temp. in a short time at pH 6-10 (7-9) with small bathing ratio of 1:2. The pretreating agent is odourless and non-stimulative to skin. The dyeing effect can be further improved synergically by combining the promoting agent in pretreating agent. 25.4.78 as 048920 (6pp5)

MATS/ ★ D21 90070B/50 ★ J5 4140-740
Dentifrice with good tooth cleaning and gingiva stimulating action - contg. fine granular, slow dissolving abrasive
MATSUURA H 23.04.78-JA-047997
E37 (01.11.79) A61k-07/16

Dentifrice can be prepd. by combining 10-20 wt. % fine granular and slow dissolving abrasive selected from calcium carbonate, calcium hydrogen phosphate dihydrate, calcium hydrogen phosphate, insoluble sodium metaphosphate, magnesium carbonate, silicic acid anhydride, aluminium hydroxide, sodium chloride, potassium chloride, ammonium chloride, sodium acetate, etc. in conventional tooth paste, wet tooth powder, tooth powder, etc.

The fine granular and slow dissolving abrasive objective dentifrice not only shows excellent cleaning effect for tooth, but also gives proper stimulus to gingiva. Thus the blood circulation in gingiva can be promoted and the gingiva can be constricted. As the result gingivitis and pyorrhea can be prevented and teeth can be protected from decaying. Pref. fine granular abrasive of dia. 0.2-0.6 mm is used. 23.4.78 as 047997 (2pp5)

KANE ★ D21 90071B/50 ★ J5 4140-741
Non-flammable nail varnish remover - comprises phenoxy:alkanol, aliphatic ketone, lower alcohol and water
KANEBO KK 24.04.78-JA-049064
E14 (E17) (01.11.79) A61k-07/04

The compsn. is obtd. by mixing and dissolving 28-68 w/w % of phenoxyalkanol (I) 5-15 w/w% aliphatic ketone, 6-25 w/w% aliphatic lower alcohol and 10-40 w/w% water, (where R : 2-4C alkylene).

(I)

The compsn. is non-combustible and can dissolve out nail enamel easily and rapidly without whitening nails while imparting disinfecting and sterilising effects. The compsn. is non-toxic and has improved dry-

ability.

The aliphatic ketone is acetone, methylethyl ketone, diacetone alcohol, acetyl acetone and/or acetonyl acetone. The aliphatic lower alcohol is ethanol, n-propanol, i-propanol, n-butanol and/or i-butanol. 24.4.78 as 049064 (6pp5)

BROT- ★ D22 89875B/50 ★ FR 2418-821
Continuous mfr. of calcium alginate fibres - by passing calcium
chloride and sodium alginate solns. through spinneret

BROTHIER LAB 03.03.78-FR-006142

A11 F01 (02.11.79) D01d-05/06 D01f-02

The process comprises continuously introducing under
pressure into a multi-filiform current of sodium alginate
soln., a current of aq. calcium chloride soln. The cal-
cium alginate fibres resulting are recovered in the form
of ranges of successive parallel fibres which are entrain-
ed in a continuous movement during which they are sprayed
with pure water and then alcohol, followed by draining
and drying.

The process is carried out in an appts. comprising a
tube contg. a spinnanet into which is directed the sodium
alginate and linked to this is a calcium chloride soln.
feed. The assembly is mounted in a manner such that a
horizontal to-and-fro movement is imparted to the exit of
the tube where the fibres leave. The tube delivers onto a
perforated continuous belt which passes over the vessels
which called the drainings and washings from the fibres
with the appropriate spraying arrangement above each.

The process is cheaper enabling automation and the
prod. obtd. is uniform. 3.3.78 as 006142 (6pp597)

Colorimetric determination of sterilising agent dosage - by indicator
dye mixt. with salt of strong acid and weak base

ANDERSEN HW PROD INC 04.10.76-US-729552

A97 J04 P34 + R14 R16 (12.12.79) *DT2729-711 G01n-21/06

Device for measuring the effectiveness of a gaseous or
vaporisable sterilant comprises a container impermeable
to the sterilant having an opening for entry of the sterilant.
It contains a mixt. of acid-alkali indicator dye and a salt
of a strong acid and a weak base coated on an interstitial
inert carrier whose interstices define passageways for the
sterilant. The salt can react with the sterilant to cause a
change in the pH of the mixt. and hence a colour change of
the indicator dye.

When the container is placed in an enclosed space to
which the sterilant is supplied, a progressive colour ch-
ange of the indicator takes place (giving a discernable
demarkation line) as the sterilant passes along the passage-
ways away from the opening.

The salt may be MgCl₂, and the indicator bromophenol
blue Na salt or methyl red. The container may comprise
two spaced strips of polyester or polyamide joined along
their edges. The sterilant is e. g. ethylene oxide or pro-
pylene oxide.

The effects of time, temp. and sterilant concn. during
a sterilisation are integrated, and the device is easy to
mfr. and use and reliable. 5.9.77 as 036928 (7pp945)

HC **D22** 89916B/50 ★GB 2021-952
 Timber treatment by immersion in pressurised liquid - after vacuum
 treatment, then application of high pressure gas, e.g. air, after
 treatment
 PROTIM INT LTD 29.06.79-GB-022721 (31.03.78-GB-012650)
 C03 F09 P63 (12.12.79) A01n-17 B27k-03/08
 Timber is treated by initially placing it in a vacuum cham-
 ber, after which it is contacted with a soln. of preserva-
 tive in an organic solvent. A positive pressure is applied
 to the soln. to force it into the timber and after a predet-
 ermined period the soln. is drained from the timber. Opt.
 second vacuum treatment may be applied to remove ex-
 cess preservative.

Finally the timber is subjected to a high pressure gas,
 e.g. air, to cause further penetration of the preservative
 into the timber. Typically the complete treatment takes
 minutes to 3 hrs.

The treatment is applied to less permeable species of
 timber, e.g. spruce or whitewood. The method reduces
 the hazards to operating staff by cutting down the amt. of
 preservative present on the surface of the wood after
 treatment. 29.6.79 as 002721 (4pp295)

 Tablet for deodorising urine pots - contains para-di:chlorobenzene,
 chlorinated isocyanuric acid and ortho-boric acid

NISSAN CHEM IND KK 22.04.78-JA-048148

E14 P34 (E13 E36) (01.11.79) A01n-17/08 A611-09 A611-11

Compsn. for deodorant tablet, contains 15-90 wt. % of para-
 dichlorobenzene, 3-35 wt. % of chlorinated isocyanuric
 acid and 5-50 wt. % of ortho-boric acid.

The compsn. brings about good releasability at the time
 of tableting and good shape-stability of the tablet. The
 deodorant tablet is placed in an urine pot, in station, hos-
 pital, etc. The deodorant tablet is used for sterilisation,
 deodorisation, repelling of insects and cleaning of urine
 pot.

In order to obtain a good quality of tablet, chlorinated
 isocyanuric acid, para-dichlorobenzene and ortho-boric
 acid are pref. granular or powdered. The amt. of para-
 dichlorobenzene is pref. 30-85wt. %, and para-dichloroben-
 zene is used for deodorisation and repelling of insects.
 The amt. of chlorinated isocyanuric acid is pref. 5-30 wt.
 %. Ortho-boric acid is used to impart good releasability,
 good shape stability to the tablet. Its amt. is pref. 10-40
 wt. %. If desired, there can be added aroma, dye, pigment
 and carriers. Tableting pressure is 20-100 kg/cm².

Web formation employing intermediate foraminous spreading section - produces wide webs of uniform thickness giving enhanced prod. efficiency

SCOTT PAPER CO 02.08.78-US-930174
F04 (04.12.79) D04h-01

An apparatus for increasing the width of a fluid-entrained fibre stream, includes a first conveying duct through which a fluid-entrained stream of fibres is passed. The stream is intercepted at the downstream end by a rotatable spreading roll, which is orientated obliquely to the first duct. This roll includes a foraminous surface which receives the fibres, the fluid passing through it. The foraminous outer surface has a lateral dimension (between the duct sidewalls) that is greater than the width of the duct at its open downstream end, as measured in a direction normal to the direction of fibre flow.

A second conveying duct spaced downstream from the first duct receives the fibre from the surface of the spreading roll. Pressure differentials are established in the ap-

apparatus to aid the initial fibre deposition on the spreading roll, and to relaunch the fibres into the second conveying duct.

The process is used for the production of items such as cosmetic pads, household towels, facial tissues, etc. The fluid can be air or water. 2.8.78 as 930174 (5pp1307)

Web formation employing intermediate spaced discs spreading section - produces wide webs of uniform thickness giving enhanced prodn. efficiency

SCOTT PAPER CO 02.08.78-US-930175

F04 (04.12.79) D04h-01

In appts. for increasing the width of a fluid-entrained stream of fibres, is described. The fibre stream is fed through a conveying duct to a rotatable spreading roll. This roll comprises a number of axially spaced-apart discs which provide flow-directing channels between them. The rotational axis of the spreading roll is orientated obliquely to the direction of flow through the conveying duct.

This results in the width of the spreading roll being greater than the conveying duct width. The fibres are diverted by moving through the channels and are then released from the channels of the roll as a stream of fluid-entrained fibres wider than the stream in the conveying duct.

The appts. is useful for the prodn. of fibrous prods. such as household towels, facial tissues, sanitary napkins, and the like. The fluid medium can be either in air or water. 2.8.78 as 930175 (6pp1307)

Recovering solvent from aq. organic solvent oil seed extract - esp. of soya using alcohol in multistage distillation

DRAVO CORP 26.11.76-US-745397

(12.12.79) *BE-861-229 B01d-03

A miscella obtd. by extracting oleaginous seed material comprising dissolved sol. components in an aq. organic solvent, is distilled to recover the solvent in fractions of different concns.

The process comprises introducing the miscella into an evaporation zone to separate the miscella into liq. and vapour-streams; contacting part of the vapour stream with a liq. reflux in a rectifying zone; condensing the vapours withdrawn from the rectifying zone and returning a portion of the resulting condensate to the zone as the liq. reflux, the remaining portion of the condensate contg. part of one of the aq. organic solvent fractions; withdrawing a liq. stream from the bottom of the rectifying zone; contacting the liq. stream from the evapn. zone with vapours in a stripping zone; withdrawing a liq. stream contg. the sol. components from the stripping zone; and condensing the vapours withdrawn from the stripping zone.

Extraction of carbohydrates and alcohols from seed material such as soybeans, renders the resultant soy flour fit for human consumption. 25.11.77 as 049217 (9pp931)

roasting pretreatment of beans prior to oil and fat extraction - to reduce phosphorus content without degradation

HOHNEN OIL KK (HOHN-) 24.02.75-JA-022666
(17.11.79) *J51097-604 C11b-01/04 C11b-03/16

pretreatment method for extraction of fatty oils and fats from beans by the use of solvents, consists of roasting raw material beans (heating beans to 230-350 $^\circ\text{C}$ for 3-60 mins. in the absence of water), controlling the water content of the beans to 8-13%, pressing and flattening the beans, collecting bean crude oil by extraction with solvents, hydrating the crude oil with water, inorganic or organic acid aq. solutions, and removing gum from the hydrated crude oil by centrifugation, filtration, etc.

By roasting beans for fatty oil and fat-extraction use, phosphorus fatty matters contained in oil-contg. cells of beans are thermal-modified and tend to swell and coagulate in the presence of water and to be removed by the gum-removal process. Consequently, amounts of the residual phosphorus fatty matters contained in raw oil (gum-removed oil) are reduced without deteriorating the quality of bean oil products, and excellent food oil of good taste is obtained. 24.2.75 as 022666, C11b-1/04, 3/16 (17.11.79) HOHNEN OIL KK (3pp) (J5 1097604)

Deodorisation unit for fats and oils - has a column with part of deflectors above partitions and part above the bowls

SVATOVO OIL FAT IND 13.04.77-SU-477274
(05.04.79) A23d-03/02 C11b-03/14

Intensified deodorisation of fats and oils, as well as compactness of the unit are ensured with each bowl featuring additional deflectors inside the column. The screen bottom is inclined towards the level setters, and part of the deflectors is mounted above the partitions forming inverted troughs. The other part is fitted above the bowls.

The raw material preheated to 190-220 $^\circ\text{C}$ is fed to the upper bowl for mixing with live steam which entrains the volatiles, while oil flows between the partitions reaching the cup of the level controller. The latter is connected to the valve with oil discharged into the bowl below. The steam with distillate and oil particles impacts the particles ensuring oil sepn. for its return into the bowl, while steam and distillate reach the free space of the column for condensation and removal. The oil passes through the remaining bowls for repeat treatment before the discharge. Lozheshnik V.K., Syркиn G.E., Shcherbakov V.I. et al. Bul. 13/5.4.79 13.4.77 as 477274 (3pp89)

Continuous vehicle washing process and appts. - with washing, treating, rinsing and blow drying stages
BURGER H 07.08.78-DT-834582
E16 Q17 (03.12.79) B60s

The vehicles pass through a washing installation by being drawn into a washing track and are washed one after the other with a detergent, then rinsed with water, treated with a protecting agent and then dried.

To assist drying, the rinsing water is applied without pressure from a low height on the vehicle surfaces; an agent for increasing the surface tension of the water and for making the rinsed surface dry and shining having been applied previously in a separate operation. The residual drops of water are removed from the surface by a ventilating appts.

The process is carried out in an appts. comprising a gantry with a rinsing bar which extends the width of the vehicle and which is adjustable in height. The bar is mounted on a support and has openings along its length.

The process enables quieter washing and drying with less energy consumption without increasing the cost or operating time. 6.8.79 as 878104 (12pp597)

Reducing the molecular weight of hydroxy-carboxy polymers - esp. hydroxy-acrylate(s), using oxidising agent in a solvent

SOLVAY & CIE 25.04.77-LU-077196

A97 (12.12.79) *BE-866-224 C08f-08/50

Mfr. of a salt of a hydroxycarboxylic polymer from a poly-

mer salt which is similar to the desired polymer salt except that it has a higher mol. wt. comprises reacting the starting polymer salt with an oxidising agent in the presence of a solvent.

The polymer salts are esp. of formula $(-CR^1R^2-C(OH)(COOM)-)$ where R^1 and R^2 are H or unsubst. or hydroxy- or halo-subst. 1-3C alkyl and M is alkali metal or ammonium. Specifically the polymer salts are Na polyalpha-hydroxyacrylates. The mol. wt. of the starting polymer salt may be e.g. 10000-800,000. A pref. solvent is water and a pref. oxidising agent is H_2O_2 .

The polymer salts are used as builders in detergent compns., and are obtd. with a high degree of whiteness. 24.4.78 as 016082 (4pp945)

Poly-alpha-hydroxyacrylic acid salts prepn. - from corresp. polylactone and base in presence of an oxidising agent

SOLVAY & CIE 25.04.77-LU-077195

A97 (12.12.79) *BE-866-225 C08f-08/44

Prepn. of a salt of a poly-alpha-hydroxyacrylic acid contg. monomeric units of formula $(-CR^1R^2C(OH)(COOM)-)$ where R^1 and R^2 are H or 1-3C alkyl and M is cation is claimed. Process comprises reacting a solid polylactone derived from the appropriate polyalpha-hydroxyacrylic acid with the base from which M is derived in a liq. medium contg. diluent in addn. to water but which does not dissolve the polylactone or the salt being produced. In addn., an oxidising agent is added to the liq. medium.

Suitably the oxidising agent is H_2O_2 and is present at 0.01-15 mol% based on the number of hydroxyacrylic units present in the starting polylactone. The salt is obtd. with a high degree of whiteness and can be used directly in detergent compns. or as a sequestering agent. 24.4.78 Add to 1450758 (5pp945)

Detergent additive giving durable softness to textiles - contains quat. ammonium type cationic surfactant, CMC or polyacrylic acid and water soluble polymer contg. cationic nitrogen

LION FAT & OIL KK 28.04.78-JA-050098

A97 E19 F06 (A11 A25) (06.11.79) C11d-10/02 D06m-13/46 D06m-15/24

An additive for cleaner which contains (a) cationic surfactant $((R_1).(R_2).(R_3).(R_4).N)^+.X^-$ (where R_1, R_2, R_3 and R_4 are alkyl, oxyalkyl, polyoxyalkylene or benzyl, and one or two of these are 8-22C alkyl, X is halogen), (b) CMC and/or polyacrylic acid and (c) water-soluble polymer contg. cationic nitrogen having density of electric charge of cation > 0.0005 . (Density of electric charge of cation = (number of cation of monomer)/(mol. wt. of monomer).).

It gives favourable appearance and durable softness to cloths at their washing time by the combined use with a cleaner consisted of anionic surfactant as a principal component.

The cationic surfactant: (a) is e.g. $((R).(R).(CH_3).CH_3).N^+Cl^-$, $((R).(CH_3).(CH_3).(CH_3).N)^+.Cl^-$, $((R).(CH_3).CH_3).(CH_2.C_6H_5).N^+Cl^-$, $((R).(CH_2CH_2O)_m.H.(CH_2CH_2O)_n$

$H.(CH_2).N^+Cl^-$, etc., (where R is 16-22C alkyl, m and n are 1-10). It is pref. present at ≥ 5 wt. % in this additive As (I), alkali metal salt of CMC having 0.4-1.2 of carboxy methyl gp. per glucose unit and/or alkali metal salt of polyacrylic acid having 200000-7000000 of mol. wt. are employed. Pref. it is present at 1-5 times the wt. of the equiv. for the neutralisation of electric charge of cationic surfactant (a). The water-soluble polymer (c) is e.g.

$(-CH(CH_2CH_2OR_1)-CHOR_2-CHOR_3-CH-O-)_n-$ (where R_1 is H or

$(C_2H_4O)_mR'$, R_2 are R_3 are H or $(C_2H_4O)_lR'$. R' is $CH_2CH(OH).CH_2.N^+(CH_3)_2.Cl^-$, n is a finite number, $1+m$ is 1-3 per unit structure. It is pref. present at 0.1-1 times the wt. of (a). This additive is desirable to be used so that the amt. of (a) should be > 0.05 wt. % of the washing cloths. 28.4.78 as 050098 (5pp170)

 Sulphamoyl-phenyl chlorophenyl pyrazoline prepn. - from
 chlorophenyl chloroethyl ketone and hydrazino-phenyl
 sulphonamide, used as acrylic and acetate fibre brightener

SALOVA RA 29.04.75-SU-129504

A60 E23 F06 (A11 A14) (30.03.79) C07d-231/06 D06l-03/12

1-(4'-Sulphamoyl-phenyl)-3-(4''-chloro-phenyl)-pyrazoline
 of formula (I) is used as optical brightening agent for
 Nitron (RTM polyacrylonitrile) and acetate fibres. It is

during surface treatment of above
 materials or added to a detergent-
 compsn.

Cpd. (I) is prepd. by reacting p-
 chloro-phenyl β-chloroethyl ketone
 with p-hydrazino-phenyl-sulphon-
 amide in aq. ethanol at pH 0-1. The
 prod. is purified by recrystallising
 it from chloro-benzene and dimethyl

-formamide (5:1) mixt.

The above method simplifies the mfg. procedure and
 gives prod. of improved purity (the prod. has m.pt. 222.5
 -223.5°C), without the use of toxic reagents (e.g. methanol
 or pyridine).

 Sepn of sulphonic acids - from solns also contg sulphuric water and
 unsulphonated hydrocarbons

ATO CHIMIE (SNPA) 22.07.71-FR-026794 (07.08.70-FR-029211)

E17 H08 (04.12.79) *BE-771-038 C07c-143/02 +C07b-13

Sulphonic acids are sepd. from untreated paraffin sulphon-
 ic acid soln. also contg. H_2SO_4 , water and non-sulphonated
 paraffins, by (a) admixing with the soln. ≥ 1 slightly polar
 (cyclo)aliphatic alcohol which forms an azeoptrope with
 water, to form a mixt. having an organic phase contg. the
 dissolved sulphonic acids, and an aq. phase contg. the
 H_2SO_4 , (b) sepg. the organic phase from the aq. phase,
 (c) neutralising the organic phase, and (d) removing the vol-
 atile components from the neutralised organic phase to re-
 cover the sulphonates under temp. and pressure conditions
 whereby the sulphonates are in a molten state.

The organic phase is neutralised with a compsn. selec-
 ted from alkali metal hydroxides and carbonates, and
 alkali(ne earth) metal (hydr)oxides, to convert the sulphon-
 ic acids to sulphonates. The ratio of the amt. of water to
 the amt. of polar alcohol in the neutralised phase is at
 most equal to the corresp. ratio for the azeoptrope which
 forms between the water and alcohol.

The prods. are esp. suitable for use in the detergents.

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. In the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry	F	Textiles, Paper, Cellulose
A+	Polymer Applns.	G	Printing, Coating, Photographic Chemistry
AE	Polymer & General Chemistry	H	Petroleum
B	Pharmaceuticals	J	Chemical Engineering
C	Agricultural Chemistry	K	Nucleonics, Explosives, Protection
D	Food, Disinfectants, Detergents	L	Refractories, Ceramics
E	General Chemistry	M	Metallurgy
E+	General Chemistry Applns.		

Typical Abstract Heading

See CPI/WPI Instruction Manual No. 1A for explanation of the various flagged descriptors.

Copies of Specifications may be ordered from our PATENTS SUPPLY DIVISION.

PATENTS COPY SERVICE

The Patents Supply Division has been organised to give an extremely rapid turnaround at low prices. The schedule of prices and turnaround times, together with the methods of ordering and payment, is given below.

SCHEDULE OF PRICES AND TURNROUND TIMES AS FROM JANUARY 1980

COUNTRY	DELAY from receipt of order within:	COST inclusive of (airmail) postage	SURCHARGE if applicable	NOTES
BELGIUM EUROPE PCT	1 day	per page £0.11, \$0.29 or Y84	—	Photocopies
FRANCE	2 weeks	per patent £1.55, \$3.60 or Y950	1p, 2c or 8Y per page if more than 20 pages	Printed copies. Delay reduced to 4 days for double the normal cost.
GREAT BRITAIN	2 days	per patent £1.65, \$3.75 or Y1000	—	Printed copies
JAPAN	4 days	per patent £1.10 or \$2.55	—	Photocopies
NETHERLANDS	1 week	per patent £1.50, \$3.45 or Y860	1p, 2c or 8Y per page if more than 20 pages	Printed copies
SOUTH AFRICA	3 weeks	per page £0.27, \$0.60 or Y170	Minimum charge equivalent to 5 pages	Photocopies
UNITED STATES	4 days	per patent £1.45, \$2.75 or Y880	13p, 25c or 80Y per page if more than 15 pages	Photocopies
WEST GERMANY	2 weeks	per patent £1.70, \$4.00 or Y1,040	1p, 2c or 8Y per page if more than 20 pages	Printed copies. Delay reduced to 4 days for double the normal cost.
CANADA SWITZERLAND EAST GERMANY SOVIET UNION	4 days	per page £0.19, \$0.50 or Y120	Minimum charge equivalent to 5 pages	Photocopies
 Copies of specifications can now be supplied for Austria, Brazil, Denmark, Finland, Hungary, Israel, Italy, Norway, Rumania and Sweden. Prices comprise actual costs plus a nominal handling fee. 				

METHOD OF ORDERING

- (i) By books of standard order forms available upon request, or
- (ii) By letter or
- (iii) By telex, to cut postal delay. French and West German patents ordered by telex are processed as rush orders at double normal cost (see NOTES above) unless normal service requested.

METHOD OF PAYMENT

- (i) On receipt of bi-monthly invoices, or
- (ii) By charges against deposit accounts. Subscribers are encouraged in their own interest to open deposit accounts with us so as to avoid the need for frequent payments.

Please address orders and enquiries to the Patents Supply Division.

PATENTS ON MICROFILM

For a number of countries, we film every patent specification in numerical sequence using a flat bed camera at 24:1 reduction ratio. The 200 ft. polyester diazo negative 16mm reels are second generation from a negative silver master. They are despatched weekly by airmail, shortly after the specifications are published.

A list of the available films is shown below, giving number of reels per country per year, annual costs as from 1st January 1980, and the dates from which film is available. Backlog film can be made available at the same annual costs as for the current year.

Please address orders and enquiries to the PATENTS SUPPLY DIVISION.

This sheet may be used as an order form for both current and backlog orders.

HAYA/ **D11** **63001T/40 =DS 2201-490**
Dough conveyor - in transporting unit of plate with tapered end and
padding band to prevent sticking

HAYASHIT (HAY /) 14.01.71-JA-001172
+Q35 (13.12.79) *DT2201-490 A21c-09/08

A support plate arrangement forming part of a conveyor
for transferring portions of dough, e.g. dough for bread
or dough for fritters, to a processing station such as a
bath of hot fat or a continuous baking oven, consists of a
rectangular, flat, inner plate, over the upper and under
surfaces, and the front and rear edges of which, a flexible
band extends.

Independently of the support arrangement there is a dr-
iving mechanism by which the band on the support plate
arrangement can be moved around the inner plate, when in
the position for delivery, so that portions of dough can be
easily and without complications, removed from their supp-
ort and be transferred to the next work station. 13.1.72
as 201490 (7pp1045)

GIDE- **D11** **53133U/37 =DS 2309-068**
pancake-making machine - with automatic regulation of liq dough
thickness

FA GIDECO (GID -) 24.02.72-FR-006262
+P28 (13.12.79) *NL7302-354 A21b-05/02

The rotary body for transferring the batter on the baking
cylinder in a machine for automatically making scotch pa-
cakes, etc., is a transfer cylinder. The forming and tr-
ansferring unit includes a second cylinder which is free to
rotate and is driven. This constitutes the forming cylinder
and has on its circumference a machined cavity. The tran-
fer cylinder contacts the baking cylinder in the zone in whi-
ch it lays on the portion of batter from the forming cylind-
er.

The machine is thus provided with a means of forming
and transferring a thin film of batter, of the simplest poss-
ible design, and which ensures uniformity of dia. and thi-
ckness in the prod. 23.2.73 as 309068 (7pp1045)

KYOW ★ **D11** **91646B/51 ★J5 4143-539**
Bread prodn. - using flour contg. carotene and/or vitamin/A and oil
and fat

KYOWA HAKKO KOGYO KK 26.04.78-JA-049597
(08.11.79) A21d-02/10

The method comprises combining either carotin vitamin A
or natural substances contg. or compsn. contg. them and
oil and fat in flour so that the additive contains effective
ingredient in amt of >5 ppm as β -carotin on flour.

Dough for bread can be improved with natural substan-
ce and the stickiness of the dough can be prevented. The
obtd. bread is excellent in volume, appearance, texture,
colour, touch, etc. 26.4.78 as 049597(8pp5)

IKK ★ **D11** **92181B/51 ★J7 9039-456**
Prepn. of bread contg. rice powder - with addn. of potassium
bromide, L-ascorbic acid and L-cysteine hydrochloride before or
during blending

KIKKOMAN SHOYU KK 28.02.72-JA-019665
(28.11.79) A21d-02/02

In the prepn. of bread contg. rice powder, potassium brom-
ide, L-ascorbic acid and L-cystein hydrochloride are
added just before or during the blending process, followed

by baking in a conventional manner. Properties of the
bread are improved. 28.2.72 as 019665, A21d-2/02
(28.11.79) KIKKOMAN SHOYU KK (6pp22) (J4 8088241)

KAOS ★ **D11** **92183B/51 ★J7 9039-460**
Liq. shortening compsn. mfr. - by mixing liq. oil, solid oil and
emulsifier contg. fatty acid glycol ester, lecithin, sucrose ester, etc.
KAO SOAP KK 05.10.65-JA-060905
(28.11.79) A21d-10 A23d-05

Method comprises mixing 80-90 wt % liquid oil (I), 0.5-4
wt % solid oil (II) and emulsifier (III) by (i) dispersing (II)
in a part of (I) with a part of (III), (ii) dissolving the rest
of (III) in the rest of (I), and (iii) mixing throughly the dis-
persion obtd. in (i) with the soln. obtd. in (ii) at $\leq 35^{\circ}\text{C}$.
(III) comprises 0-3 wt % fatty acid mono(di)ester of glycer-
-in, 6-16 wt % fatty acid mono(di)ester of propyleneglycol
0.1-2 wt % lecithin 0-5 wt % fatty acid ester of polyoxyethy-
-lene sorbitan, and 0-5 wt % fatty acid ester of sucrose.

Used for making cakes, pastries, etc. The shortening
shows good flowability at low temp. (to 5°C), and gives
excellent baking characteristics. 5.10.65 as 060905 A21d-
10/00, A23d-5/00 (28.11.79) KAO SOAP KK (3pp83)

HAYA/ **D11** **54417Y/31 =US 4178-147**
Continuous dough roller for pastry and bread - has conveyor rollers
beneath faster moving endless rolling out unit
HAYASHIT (RHEO-) 27.01.76-JA-007648
(11.12.79) *DT2703-331 A21c-03/02

Appts. for continuously stretching cake or bread dough in-
cludes rotatable stretching rollers movable about an end-
less path; a conveyor belt below the lower straight part of
the path for transporting dough to engage the rollers; ≥ 1
rotatable transport roller downstream of the conveyor; the
conveyor and transport rollers being driven at progres-
sively faster speed in the downstream direction; and a
drive to move the stretching rollers along the lower part
of the path in the same direction as the transpory roller
but at a higher linear speed than the peripheral speed of
the transport roller.

The stretching efficiency is improved. 25.1.77 as
762319 (10pp1376)

GRIN **D11** **63105Y/36 =US 4178-393**
Monoglyceride phosphatide powder additive for bread etc. - prepd.
by spray cooling moltn mixt.

GRINDSTED VAERKET A/S 03.05.76-GB-018022
(11.12.79) *BE-854-243 A21d-02/16

Prepn. of a pulverulent, free flowing monoglyceride ad-
ditive for use in the prepn. of farinaceous and starch-
contg. edible prods. is described. The individual particles
contain in constant proportion (a) a monoglyceride and (b)
a lecithin. Process comprises melting distilled monogly-
ceride of satd. 12-12C fatty acid, and adding a dry leci-
thin in an amt. of 0.1-40 wt.% of the resulting mixt. The
mixt. is then converted to particles by spray cooling with-
out addn. of water.

Pref. the lecithin is nonhydrolylated soybean lecithin
and comprises 0.2-30 (0.5-10) wt.% of the mixt. The prod.
is used in prodn. of bread, macaroni, spaghetti etc. and
gives as good a baking (or cooking performance as a mono-
glyceride hydrate. 2.5.77 as 792612 (9pp945)

Meat roll press - with pneumatic cylinder reciprocating upper of two
semi-cylindrical shells
TENNINGER A 08.06.78-DT-825084
(13.12.79) A22c-07

Irregular pieces of meat are prepd. by deforming them to the regular cylindrical shape needed for rolls of smoked ham. A pneumatic press actuates the upper of two semi-cylindrical shells while the piece of meat is moved axially and turned by hand. The normally conical piece of raw meat is held at both ends by two hands, as the pneumatic press cylinder is reciprocated at a rate which is adjustable by a throttle valve.

This does not change the structure of the first-class meat and causes no scrap. Rolls of uniformly high quality are turned out in a continuous process. 8.6.78 as 825084 (15pp39)

SHIM- ★ D12 91320B/51 ★DT 2841-121
Fish meal prodn. with recovery of all usable constituents - using high pressure boiler, dewaterer and vacuum dryer without pollution
SHIMOSE SHOKUHIN CO 12.06.78-JA-070616
(13.12.79) A231-01/32

In a batch process for the prodn. of fish meal with the complete recovery of solid, gaseous and fluid constituents, which are ejected from a horizontal, cylindrical, high pressure vessel operating in a closed system.

All gas and fluid conduits consist of closed pipe sections. The solid constituents are processed in a prod. cooler, a grinder and a storage silo. The gaseous constituents are handled in two condensers of the cyclone type, arranged in series, which are able to separate the malodorous vapours, a plate condenser for steam, and a cooler for gas which can be condensed.

Following these there are, one water jet ejector, three water jet ejectors through which solns. of 5% H_2SO_4 , 10% NaOH or 4% NaClO are circulated, a gas absorber working with active carbon and a blower. The fluid cpds. are fed through a pressurised water tank, a self-cleaning filter and a self-cleaning oil-sepg. unit, to a vacuum vaporiser. This latter produces a conc. fluid which is delivered to a dryer for redn. to a soluble dried fish. This is converted to the required prods. by a cooler and a grinder. 21.9.78 as 841121 (32pp1045)

Gutting and cleaning tool for fish - has cutter piercing throat and belly with clamp for intestine
TRIO ENG LTD A/S 30.05.78-NO-001875
(13.12.79) A22c-25/14

A tool fitting on to a machine, has at its free end a projecting lance together with a clamping arrangement by which the lower intestine of a fish can be removed at the anus. The leading edge of the lance is inserted through an incision in the throat of the fish and is run along the inside of the belly. The cutter is designed so that it can be lifted or tilted to cause it to penetrate the belly wall. The tool is hollow and is connected to a supply of a fluid or a gas.

The removal of the lower extremity of the alimentary tract is effected without damage to it and consequent infection of the flesh during the cleaning process. 29.5.79 as 921847 (10pp1045)

Edible protein fibre prodn - by spinning aq soln of animal proteins contg unsatd fatty acid(s) or salt(s) thereof
ASAHI KASEI KOGYO 15.11.71-JA-090599
F01 (28.11.79) *DT2244-930 A23j-03

Fibre-forming props. of animal proteins are improved by adding to an aq. protein soln. myristoleic, palmitoleic, oleic, linoleic, linolenic, sarachidonic or clupadonic acid, or NH_4 , Na, K, Ca, Mg, Ba or Al salt thereof, in an amt. of 2-80 wt % w.r.t. the animal proteins (pref. 5-20 wt %). Very fine fibres can be produced. 15.11.71 as 090599, A23j-3/00 (28.11.79) ASAHI KASEI KOGYO KK (3pp)(J48056850)

UNIL ★ D12 92198B/51 ★NL 7806-080
Coherent solid meat prods. - made by coating pieces of meat with an emulsifier, compressing together and heating
UNILEVER NV 05.06.78-NL-006080
(07.12.79) A23b-04 A231-01/31

Coherent meat products are made by bonding smaller pieces of meat together. Pieces of raw meat are worked mechanically until an adherent deposit has formed on the meat. An effective amt. of an emulsifier (I) is then added and the mixt. is worked again until the (I) is distributed uniformly over the surface of the meat. The coated meat is then loaded into a container, compressed, and heated to a core temp. of $\geq 60^\circ C$.

The process gives large coherent pieces of meat made up from smaller pieces. The meat does not fall apart when heated, as is the case e.g. with pieces of meat bound together with a gelatin binder. 5.6.78 as 006080 (9pp513)

BMEA= ★ D12 92432B/51 ★SU -656-609
Gripping device for meat carcasses on suspension track - has plates with locking means, which enables carcasses to be lifted off and carried for weighing
BELO MEAT IND RES 08.07.77-SU-505344
(18.04.79) A22b-07

Gripping device for fitting meat carcasses on suspension track and withdrawing them, comprises body and drive-gripping mechanism. Productivity is increased, damage to the carcasses prevented, and construction improved, by providing the body with support plates, having slots and hollows for fitting the hoops of the trolleys with the carcasses. The gripping mechanism is made as strips with locking elements, the number of which equals the number of hollows, which are capable of being moved along the body and so fix the hoops in the hollows.

 on. of simulated sausage products - with textured vegetable
 reins, but with good sausage-like mouth feel
QUAKER OATS CO 12.09.77-US-832535
11.12.79) A23j-03
 sausage analogue is prepd. as follows (all by wt.): (a)
 aq. mixt. of flavours, spices, and colouring agents is
 epd.; (b) a 1st. phase is formed by continuously mixing
 al wheat gluten, H₂O, and salt into a dough which is then
 ruded to give strands of hydrated gluten; (c) a 2nd.
 ase is prepd. by mixing 1 pt. of textured protein concen-
 te (I) with 1-4 pts. of the aq. mixt. in (a), then cutting
 o the required size; (d) a 3rd. phase is formed from an
 ble protein fibre (II); (e) a 4th phase is prepd. by blend-
 12-25 pts. egg white, 7-10 pts. non-fat dry milk, 3-4

pts. Na caseinate, and 2-4 pts. dextrose with 20-35 pts.
 fat heated to 180-220°F., then forming a gelatinous mass
 by adding 30-40 pts. of the aq. mixt. (a) heated to 170-
 212°F.; (f) a 5th phase is prepd. by blending 1 pt. of fat
 at 180-220°F. with 1-3 pts. of the aq. mixt. (a); (g) each
 phase is adjusted to 40-60°F.; and (h) all the phases are
 mixed and formed into patties and links which contain 10-
 25% of the 1st phase dough.

The above sausage prepd. from (I) and a variety of
 separate phases contributing various characteristics has a
 high protein/low fat content, but has sausage-like chewi-
 ness, biting props., juiciness, mouth lubrication cohesion
 and frying properties. 12.9.77 as 832535 (6pp478)

 ed additive to increase milk yield of dairy cows - contg.
 methionine hydroxy analogue, enzyme of genus *Aspergillus* and a
 ffer

AGRIMEL LTD 22.12.76-CA-268580
C03 (D16) (04.12.79) A23k-01/18
 feed additive for dairy cows comprises essential nutri-
 ts, methionine hydroxy analogue, a fungal enzyme of
 e genus *Aspergillus*, and a buffer.

The additive is in the form of dry premix as a top dress-
 ing for a regular feed as it may be part of the dairy feed.
 pref. strain of *Aspergillus* is *A. oryzae* and is a well
 known enzyme extract, it increases the utilisation of the
 analogue and helps in maintaining proper intraruminal and
 extra-ahomalar enzyme concn. Suitable buffers are e.g.
 HCO₃, CaHCO₃ or pref. NaHCO₃.

The feed improves milk yield, the effectiveness of the
 methionine hydroxy analogue is greatly increased by com-
 bining proper adjuncts, and it is more palatable to dairy
 cows than previous analogue compns. 22.12.76 as 268580
 (6pp957)

 reserving freshly harvested high-moisture hay - by applying a
 ute culture of *Lactobacillus acidophilus*

NOLD MC 23.06.75-US-589711
C03 (D16) (04.12.79) A23k-03
 method of treating freshly harvested high-mositure hay to
 reserve during open storage without drying, and maintain
 nutritive value, comprises applying a dilute culture of
acidophilus to the hay in open air, in concn. of 45-90
 million organisms / ton.

L. acidophilus may be applied to the hay from an aq.
 carrier as it is collected from swaths or windrows or as
 leaves the swather or windrower before drying. The hay
 may be gathered within 24-36 hrs after treatment or within
 72 hrs. under adverse conditions. As a result of the
 treatment there is a redn. in heating in the newly formed
 lled or stacked mass of hay and redn. in mould formation.

The method maintains the nutritive values, of the hay
 which is more easily ground and has higher palatability.

 re racemic- and meso-tartaric acids prepd from alkali maleate -
 d hydrogen peroxide with alkali metal tungstate catalyst

DEUTSCHE GOLD & SILBER 26.02.75-DT-508228
E17 (13.12.79) *BE-827-604 C07c-59/14

re racemic acid and meso-tartaric acid are prepd. by
 acting H₂O₂ and alkali maleinate in a molar ratio 1.01-
 1 at 70-90°C and pH 3-5.5. in the presence of an alkali
 tungstate. The formed alkali salt of cis-epoxysuccinic ac-
 and the alkali tungstate (opt. after reacting the excess
 O₂) are converted to the free cis-epoxysuccinic and tung-
 stic acids by treatment with strongly acid cation exchang

-er. The free cis-epoxysuccinic acid is then hydrolysed
 to racemic acid, opt. after removing the tungstic acid us-
 ing an anion exchanger. The racemic acid and meso-tart-
 aric acid are then recovered conventionally from a tungstic
 acid-free hydrolysis mixt.

Pref. the initial molar ratio of H₂O₂:maleic acid is 1.1-
 1.3:1. The acid prods. are of sufficient purity for use in
 the food industry. 26.2.75 as 508228 (9pp913)

USRU D13 09550X/06 = DS 2529-086
 Alkylene glycol alginate prepn - from acid-treated phaeophyceae
 algae by reaction with alkylene oxide without alginic acid
 separation

UNIROYAL INC 16.07.74-CA-204887

A11 (13.12.79) *DT2529-086 C08b-37/04

Alkylene glycol alginates are prepd. from algae of the cl-
 ass Phaeophycene. The algae are treated with an aq. soln.
 of a strong acid, e.g. HCl or H₂SO₄, then sepd. from the
 soln., washed with water and the water content of the alg-
 ae reduced to 13-40%. The algae are treated with 1-3 mo-
 les of an alkylene oxide, pref. 1,2-epoxypropane. (based
 on the alginic acid).

Reaction mixt. is mixed with water, non-reacted carb-
 oxyl gps. in the resulting suspension at least partly neutr-
 alised and insoluble algae residue removed. A strong acid
 is added to the extract soln. to obt. the desired level of
 free carboxyl gps. and the alkylene glycol alginate is rec-
 overed. The alginate is obtd. in good yield. 30.6.75 as
 529086 (12pp068)

Foam prods. for use in the food and fodder ind. esp.
 whipped albumin and polysaccharide prods. are produced
 by pressurising the solns. or dispersions of froth form-
 ing materials to a pressure of 5-750 bar (40-400 bar).
 Intense shearing forces are then applied by sharp deflect-
 ions while the pressure is being released. The foam prod-

used can be processed wet or can be dried.

This produces whipped prods. which are extremely stable. They can be converted to dry powder which is readily turned into foam. 7.6.78 as 824911 (15pp39)

BIOC- ★ D13 91263B/51 ★DT 2824-977
Fat contg. milk protein tablets prodn. - from skim milk powder, non-milk fat and sucrose
BIOCHEM GMBH 07.06.78-DT-824977
(13.12.79) C23c-09

Prodn. of fat-contg. milk protein tablets comprises first processing skim milk powder (A) and non-milkfat in about equal amts. to a fat concentrate. This is then blended with more (A) in about 1:4 ratio, then this mixt. combined with sucrose in about 7:3 ratio and the final mixt. tabletted.

Sucrose is pref. used in granulated, crystalline form and the mixt. may include a flavouring. Opt. the non-milk fat is mixed with skim milk to give a fat-in-water emulsion which is dried to give the fat concentrate directly.

Only skim milk is needed as protein source, tableting is easy and tablets have long storage times. Non-milk fats are much more stable (and generally cheaper) than milk fat and also serve as lubricants during tableting. The sugar minimises caking of (A) during processing. 7.6.78 as 824977 (7pp1251)

SOLL- ★ D13 91317B/51 ★DT 2827-404
Sweetmeats in rod-or bar-form from bands - formed by pouring calibrated mass over cylinder to conveyor
SOLLICH SPEZIALM KG 22.06.78-DT-827404
(13.12.79) A23g-03/08

Mass of material such as caramel, toffee, fudge, fondant, jelly, etc., whilst still in the hot and fluid condition, is ejected from the machine producing it, in the pressureless condition, on to a rotating cooling cylinder. On this, it is spread out into a band, cooled, consolidated and then stripped off on to a conveyor. The belt transports it to a further processing station in which the mass forming the band is divided into bars or similar for thermal treatment.

Arrangement dispenses with extrusion processes which prejudice the structure of the mass, and allows continuous prodn. without complicated equipment, of sweets in the form of rods or bars, laminated or otherwise. 22.6.78 as 827404 (12pp1045)

CARL- ★ D13 91331B/51 ★DT 2918-583
Automatic synchronisation of dispenser with mould boxes - esp. for chocolate creams, by planet gears actuating servo motor
CARLE & MONTANARI S 07.06.78-IT-024299
(13.12.79) A23g-01/22

Means of determining the actual speeds of the mould plates, an operating mechanism including a motor and a reduction gear for the displacing of the dispenser by means of a cam operating levers, and means of adjusting the relative speeds of the moulding plates and of the dispenser, are incorporated in a plant for the prodn. of chocolate creams, liqueurs, etc. There are means of correcting the speed of the motor and the reduction gear, which are energised as a result of the differences detected.

Errors in alignment which arise between the moulds and the dispenser injecting the filling into the chocolates, are overcome as a result of the tolerances in the chains and the driving mechanism. The machine works at high speed without the continuous presence of an operator and without highly expensive electronic equipment. 5.9.79 as 918583 (20pp1045)

CARL- ★ D13 91373B/51 ★DT 2922-167
Machine for caramel mfr. - has ribs forming airtight chambers for press mould drum housing
CARLE & MONTANARI S 07.06.78-IT-024928
(13.12.79) A23g-03/12

A machine for the mfr. of caramel sweets has the housing for the drum-shaped press mould split into an upper hinged and a lower fixed half. Both halves have internal ribs which cooperate with rings on the press mould drum to form almost airtight chambers. The two outer chamber accept the movable plungers of the press mould. The central chamber (press chamber) is connected to a vacuum system. The housing end shields are detachable by power

actuators for easy drum exchange.

This saves time when repairs are needed. The fine sugar dust is reliably removed and requires no manual attention for its removal. 31.5.79 as 922167 (24pp39)

NEXU- ★ D13 91376B/51 ★DT 2922-31
Whippable and whipped cream prods. - contg. partial glyceride or polyglyceride ester of unsatd. fatty acid as emulsifier (NL 4.12.79)
NEXUS APS 31.05.78-GB-025668
(13.12.79) A23c-13/12 B01f-17/34

Foam-like whippable or whipped creams (or cream-like prods.) contain as emulsifier (I) a (poly)glyceride partial ester with 4-26C fatty acids of formula $(A\% + 3K)B\% \geq 500$ (≥ 515). (A = wt. % 4-10C satd. carboxylic acids residues in the partial ester; B = wt. % unsatd. carboxylic acid content, both A and B being expressed on total wt. of acid residues. K is a constant = 3 when (I) is a polyglyceride or $3^{2/3}$ when it is a glyceride).

Esp. (I) is 0.2-2 (0.4-0.8) wt. % on total prod. and the compsn. may also include 0.5-5 (1-2) wt. % stabiliser. The material used is esp. cream subjected to ultra-high temp. or ultra-rapid pasteurising treatment.

(I) improves whipping properties (esp. at low milk fat content); water retention and resistance to 'buttering' when whipped for a long time. It also protects against spoilage provides an acceptable prod. when homogenisation is carried out under pressure. 31.5.79 as 922317 (46pp1251)

GENO ★ D13 91393B/51 ★DT 2922-787
Fruit juice powder easily soluble in cold water - has starch hydrolysate of low dextrose equivalent as carrier
GENERAL FOODS CORP 07.06.78-JA-068461
(13.12.79) A231-02

Fruit juice powder which is easily soluble in cold water contains as carrier a starch hydrolysate (A) of DE value 2-5 and amylopectin content ≥ 95 wt. %, and 5-95% (on final wt. of the powder) of a solid, dewatered fruit juice supported on (A). The powder is made by homogenising (A) and the juice, then drying. Pref. (A) is made by partial hydrolysis of a starch (esp. glutinous rice or barley) of $\geq 95\%$ amylopectin content with α -amylase until the required DE is reached.

Powders have low hygroscopicity, good storage stability and good cold water solubility. 5.6.79 as 922787 (9pp1251)

BELF- ★ D13 91433B/51 ★FR 2419-030
Textured food products based on milk proteins - in which casein is enzyme hydrolysed during prepn.
BEL FROMAGERIES 10.03.78-FR-007085
(09.11.79) A23j-03/02

The process for the prepn. of stable infusible food products from a hydrated paste based on milk proteins followed by texturing, comprises forming a homogenous mixture (suspension) consisting of an aq. soln. of milk proteins with a proportion of seraproteins in amt. up to 50% of the total protein, apt. with a supplementary ingredient from glucides, lipids and other proteins.

In the paste the casein content is 15-30%, the water content is 35-80% and the dry solid content is at least 18%. In at least the prepn. of the suspension or the texturing, the casein is submitted to the action of an enzyme of animal or microbial origin used in cheese mfr. to hydrolyse the casein apt. in the presence of bivalent ions and added phosphates.

The products may be used as meat or fish substitutes or as a protein supplement. The process enables the use of milk proteins which have previously been unsatisfactory for use because of instability partic. to heat. 10.3.78 as 007085 (16pp597)

AJINOMOTO KK 04.05.78-JA-053322
A97 (A11) (13.11.79) A231-01/20

Prodn. of protein-food (I), comprises (1) dissolving ≥ 1 g ascorbic acid, erythorbic acid, CMC, sulphurous acid, cystine, homocystine, alginic acid, and their salts into soy bean milk, (2) preparing soy bean milk-curd and (3) cooling it.

Soy bean curd-(tofu) has been used as protein-food in Japan. However, it contains much water and therefore cannot be stored for a long time, and when it is dried, it cannot return to the initial texture. The dried (I) regains its initial curd-texture, when (I) is soaked in (hot) water.

The quantity of the above additives used is 0.1-0.0001 parts per a part of protein in soy bean milk. The cooling temp. in the step (3) is -80 or -10°C, e.g. (-60 or -40°C). 5.78 as 053322(3pp42)

Preserving meat in miso - with addn. of neutral and/or alkaline protease and a relatively small quantity of salt
TAKADA SHOTEN KK 02.05.78-JA-052922
(13.11.79) A23b-04

the prodn. of meat preserved in miso(misozuke) (I), 1.5 wt. % of neutral and/or alkaline protease is/are first added and a relatively small quantity of salt is then added for elevation of the protease-activity.

Method can be carried out without complicated procedures such as the spraying of salt and protease onto the surface of meat. The prod. does not harden during storage and maintains a fresh appearance for a long time. In an example 10 pts.wt. malted rice, 35 pts.wt. soy bean, 4 pts.wt. of salt, 0.12 pts.wt. sorbic acid, a trace of vitamin B₂ and 1 pts.wt. protease were mixed and fermented for ~15 days. 5.78 as 052922(2pp42)

Prodn. of hard butter - by sepg. high m. pt. components from fat and oil compsn. and crystallising medium range m. pt. components
ASAHI DENKA KOGYO 19.05.75-JA-059281
(26.11.79) *J51136-858 A23d-05 C11b-07

A hard-butter having superior qualities and properties is produced by solvent-fractionating methods.

To 1 pt.wt. of fat and oil, 0.05-0.7 pts.wt. of a solvent are added, and the mixt. is cooled at 0.03-0.09°C/min. and the obtd. pptes. are removed from the mixt. Thus 80-95% of components having high m. pt. are removed. To 1 pt.wt. of the remaining mixt. 0.25-2.8 pts.wt. of solvent are added, and the mixt. is cooled rapidly, and the obtd. pptes. are removed from the mixt. Thus the remaining components having high m. pt. are removed completely. To 1 pt.wt. of remaining mixt. 1.5-4 pts.wt. are added and the mixt. is cooled. The components having medium range m. pt. are obtd. are crystals.

The crystals are used as hard-butter. 19.5.75 as 059281, C11b-7/00, A23d-5/00 (26.11.79) ASAHI DENKA KOGYO (7pp) (J5 1136858)

Accelerating growth of domestic animals and fowls - by feeding extract prepd. by alkali treatment of yeast
MITSUI TOATSU CHEM INC 22.01.70-JA-005381
C03 (D16) (27.11.79) A23k-01

Method comprises by feeding feed-stuff contg. extract, prepared by alkali treatment of yeast to the domestic animals and fowls. Efficiency of feed-stuff is elevated.

In an example, 10l of fermentation broth, contg. 2.78% wt. based on dry weight, of yeast, was subjected to centrifugal sepn. to give 1.308g of concentrate, which was then suspended in 5l of water. The suspension was subjected to centrifugal sepn. and the same suspending and centrifugal separation were repeated to give 1.227g of creay yeast mycelium. 2.83 l of water and 1.89 g of NaOH were added to the yeast mycelium and after suspending, the suspension was boiling for 10 min. pH of the suspension was brought to 7.0 by addn. of aq. HCl and then the suspension was further boiled for 60 min. After cooling, the suspension was subjected to centrifugal sepn. to give 2.87 l of extract. pH of the extract was brought to 1.46 by addn. of 6 N aq. HCl, and the extract was allowed to stand at cold condition for 30 min. to settle the deposit. Supernatant was removed by decantation, and residue was further subjected to centrifugal sepn. and then dried below 60°C, to recover 25.56g of white powder of alkali extract of yeast. Usually 0.1g of the yeast extract was added to feed-stuff. 22.1.70 as 005381, A23k-1/00 (27.11.79) MITSUI TOATSU CHEM. INC. (3pp68)

ODFO= ★ D13 92275B/51 ★ SU -655-379
Supplementary feed for ruminants - prepd. by subjecting peat to hydrolysis with conc. sulphuric acid, adding phosphoric acid and urea, and heating to produce glycosyl-urea

ODESS FOOD IND TECH (ALWO=) 20.11.75-SU-192541
C03 (08.04.79) A23k-01/22

Supplementary feed for ruminants is prepd. by subjecting to acid hydrolysis a source of polysaccharides, adding urea, and heating the mixt. at 60-65°C to form glycosyl-urea. The quality of the prod. is improved and its price is reduced by using peat as a source of polysaccharides.

The hydrolysis of peat is pref. carried out with H_2SO_4 (concn. 93%) in a screw hydrolyser over 30-40 sec. The consumption of the 93% H_2SO_4 is 0.15-0.20 kg per kg of peat. The mass is then diluted with a three-fold quantity of hot water, the inversion of di-, tri- and oligo-saccharides is carried out at 120-130 °C for 20-30 mins. The hydrolysate contg. 7-8% of reducible substances and 3% of H_2SO_4 is neutralised with milk of lime to a residual acid content of 0.5-0.7%. The hydrolysate is concentrated under vacuum to 20-30% of sugars and 2-2.5% H_2SO_4 . Then 75% H_3PO_4 is added to a total acidity of 9-10%. The mass is reacted with urea in an amt. of 1.5 mole per 1 mole of reducible substances, at 60-65 °C for 3.5-4 h. The yield of glycosylurea is 50-60%.

The final prod. ('Oti-tort') contains (in wt.%) glycosylurea 11-13, total nitrogen 5, phosphones 1.70, dry substances 45-58. The proteinaceous nitrogen of peat is advantageously combined with non-proteinaceous nitrogen of glycosylurea.

Automatically controlled roasting oven for meat joints - programming buttons select operational temperature, starting time and duration

LICENTIA PATENT GMBH 15.11.73-DT-357041
+P28 Q74 R43 R59 (13.12.79) *DT2357-041 A23l-01/31
The starting roasting time and a finishing roasting time are maintained constantly with a ratio between starting and finishing times of 2:1, in a process for automatically roasting different sizes and kinds of pieces of meat, in the roasting chamber of an oven. The starting temp. is 200°C whilst that for the making ready of the roast is $\leq$ 200°C.

The period of time during which the roast is made ready, is made up from a variable continuation-of-roasting time and the constant finishing roasting time. The continuation-of-roasting time is dependent upon the actual wt., and the continuation-of-roasting temp. is determined by the kind of meat, whilst during the finishing roasting time, the roasting chamber heating is turned off.

The process makes it possible, not only to determine a total roasting time ensuring automatic careful treatment, having regard to the size and/or wt. of the meat and its kind, but also, the time at which the roasting will be finished is definitely fixed beforehand. 15.11.73 as 357041 (6pp1045)

MILK=★ D14 91385B/51 ★DT 2922-531
Centrifugal liquid homogeniser - with liquid speed reducing means facing reaction nozzles on rotor
MILK IND RES INST 01.06.78-SU-622368
J02 P13 (13.12.79) A01j-11/16 A23c-07 B01f-03/08

A centrifugal homogeniser for liquids such as milk or milk prods. uses a hollow rotor with two reaction nozzles through which the liq. is discharged at a high velocity. This velocity is reduced immediately by letting the jets impinge on a corrugated surface on a stationary ring or on vanes attached to the rotor.

In addn. to a 5-10% improvement in the efficiency of homogenisation, some versions have a power consumption which is reduced by a factor of 1.5-2. 1.6.79 as 922531 (13pp39)

animal fodder concentrate prodn. scalding unit - has drum with
loading hatch at one end and two segmented doors at the other
through which product is unloaded

LIPETSK TSENTROLIT 05.05.74-SU-021055
(15.04.79) A23n-17

animal-fodder scalding unit, for use in stock-breeding
farms, comprises cylindrical drum with loading hatch and
end cover. To make the unloading of the prod. possible
without dismantling the cover, the latter is made in two
segments hinged to the middle part of the drum and fixed
in the open position along the axis of the drum.

The initial components are milled and loaded through
the hatch into the drum. The two halves of the end cover
are fastened against the end of the drum. By reversing
the rotation of the drum the whole of its vol. is filled.

The additives are also loaded through the hatch, which
is then closed. The liquid components and steam are
admitted, and the powerful rotation guarantees complete
mixing, so that the concentrate is formed quickly. The
segmented doors are opened and fastened to the projecting
bracket so that the concentrate is discharged.

animal feed extruder - has body with screw inside and
proportionator, linked together by pipe contg. single turn screw, to
prevent clogging

IVANCHENKO A I 10.08.76-SU-396115
(15.04.79) A23n-17 B29b-01

extruder for making mixed animal feed from free-flowing
material, comprises a body with the screw unit housed
inside it and a proportionator connected to the body by
means of a pipe in which another screw is housed. Clogg-
ing of the pipe is eliminated by fitting the screw so that it
can be moved relative to the housing and has a single-turn
wind-on.

From the proportionator, the free-flowing materials
pass along the pipe on the screw, so that it is forced to
break up. This broken material moves along, because
of the geometrical parameters of the screw, in conjunction
with its partial rotation, guarantees increased productiv-
ity when compared with the proportionator.

By making the screw with a single-turn wind-on, the
masses in the material are squeezed out freely, preventing
forced cramming of the material and eliminates blocking
of the pipe. To reload the screw, it is moved back along
the pipe and acts on a terminal switch which controls the
motor on the proportionator.

Centrifugal ring for aerating sewage tank surfaces - has angularly adjustable vanes fixable individually to equally adjustable rings
KAELIN JR 12.06.78-CH-006372
(13.12.79) C02c-01/10

Each vane together with ≥ 1 flow guide wall forms a separate fluid delivery unit in a centrifugal device for circulating and aerating water, esp. sewage in clarifying tanks; the device being supported by a vertical driving shaft.

Whilst it is working, the inlet side of the flow guide is below water level; the outlet side being mainly above water level. Each separate flow guide unit can be detached individually from the supporting arrangement on the driving shaft. The attachment points between the flow guide units and the supporting detail are arranged so that the vane outlet angle α can be varied over a definite range.

Arrangement provides a surface ventilating centrifuge which can be mfd. from standard, mass produced parts, irrespective of the operational characteristics required. 8.6.79 as 923375 (14pp1045)

Sepn. of oil and suspended particles from waste water - using fluoro-carbonated filter bed to coalesce oil and trap particles
AGENCE NAT VALORISATION 09.03.78-FR-007720 (18.07.75-FR-022555)

J01 (09.11.79) B01d-17/02 C02c-01/38 C10g-33/06
Waste water from oil refinery installations is purified of its oil by coalescence as the effluent is passed through a fixed bed of varnish-coated, granular material partic. sand. The varnish contains a fluorocarbonated deriv. which offers a stable, chemical liaison with the granular material.

In this addn. the process comprises two stages as follows: (1) a comparatively long filtration stage during which the effluent is passed through the bed to produce coalescence and sepn. of the emulsion while suspended impurities are trapped in the bed. The effluent pref. drains downwards through a fixed bed supported on a grill. The top of the bed is unrestricted. The second stage is (2). A comparatively brief regeneration stage during which a washing fluid is passed through the bed to entrain impurities which are carried away for sepn. The washing fluid pref. rises, counter-current through the bed which is broken up and temporarily expanded during washing. The washing fluid is pref. water or water together with compressed air.

Process makes provision to deal with suspended impurities while retaining the simplicity and economy of the original process. 9.3.78 as 007720 Add to 18.7.75-022555 (12pp448)

Regulating pH in a low ion concn. potentiometric measuring system - passing sample over membrane contacting acid or base

ORION RESEARCH INC 13.01.78-US-869316 (07.03.77-US-775210)
A89 J04 R16 R26 (19.12.79) *FR2383-477 G01n-27

Low levels of ion activity are measured in a potentiometric system, and the pH of a sample stream adjusted by the passive addn. of an acid or base reagent comprises passing the stream over one side of an inert, reagent-permeable; ion-impermeable non-wetting membrane, whose other side is in contact with the liq. or vapour of a reagent reservoir.

The pH adjustment is made without dilution of the sample stream and without introducing any interfering, reactive or test ions into the stream.

Low levels of sodium ion activity can be measured without interference from hydrogen ions using piperidine as the base reagent. Chloride ion activity can be measured without interference from hydroxide ions using acetic acid as the acid reagent. 3.3.78 as 008497 (5pp931)

Water dispenser - using supply bottle inverted in reservoir top with sterilising lamp surrounding bottle neck

ULTRA DYNAMICS CORP 13.03.78-US-885880
(19.12.79) C02b-03/02

The water dispenser has a top opening into which a bottle of water is inverted. A water reservoir is fed by gravity from the inverted bottle of water. An annular collar surrounds the top opening and from this depends a device for irradiating water in the reservoir.

Pref. the device emits UV and ozone-producing radiation at wavelengths of 1840Å and 2537Å. The device may be a circular lamp which encircles the top of a bottle inverted into the top of the dispenser.

The appts. produces purified water. Often purified water is supplied in bottles which are stored under non-hygienic conditions. Thus, when inverted into the top of a reservoir contaminants can pass into the water from the outside of the bottle. The present appts. obviates this difficulty. 12.3.79 as 008687 (4pp295)

Removing phosphates from effluent by the activated sludge process - with countercurrent extn. of the phosphate contg. sludge
UNION CARBIDE CORP 28.10.75-US-626459
(24.11.79) *BE-847-702 C02c-01/06

In process the waste water is mixed with the activated sludge and an O₂ contg. gas in an aeration zone for a sufficient time to both lower the biological oxygen demand (BOD) and for the microorganisms in the sludge to absorb the phosphates. The purified water is then sepd. and the sludge contg. the phosphates is passed to an extn. zone where (most of) the sludge is maintained in an aerobic state.

The sludge is extracted countercurrently for 2-10 hrs by introducing into the lower part of the zone an extracting liq. of low phosphate and solids content (not exceeding 200 mg/l). From the top of the zone a liq. enriched in phosphates is withdrawn and from the bottom the extracted sludge is withdrawn and (part of) this is recycled to the aeration zone. The flow rate of extracting liq. is 0.7-2 times the rate of withdrawal of the liq. enriched in phosphates.

A further process comprises using a gas contg. ≥ 50% O₂ in the aeration zone to establish a dissolved O₂ content of ≥ 2 ppm. the aeration zone comprising several sub-zones.

Process provides better extn. of phosphates from both the activated sludge and the waste water c.f. prior art processes. 27. 10. 76 as 128413 (clg. 28. 10. 75-US-626459) C02c-1/06 (24. 11. 79) UNION CARBIDE CORP. (22pp) (J5 2055258)

Oil removal from oil-in-water emulsions - by passage through a fibrous mass contg oleophilic, hydrophobic particles
IMPERIAL CHEM INDS LTD 11.10.74-GB-044078 (11.03.74-GB-010687)
H03 J01 + Q42 (26.11.79) *BE-826-563 B01d-17/04

Oil is removed from O/W emulsions by passing the emulsion through a fibrous mass in which the external surface of the fibres is penetrated by finely divided particles with oleophilic and hydrophobic properties, and recovering the oil droplets formed by coalescence. The process is esp. useful for removing oil from emulsions formed during the cleaning of marine and other oil tankers, oil cooling circuits etc.

The fibres can be (a) homogeneous, with the oleophilic particles adhering to and penetrating into the surface, (b) homogeneous fibres with a coating of a non-fibre-forming polymer or resin to which the oleophilic particles adhere, or (c) conjugate fibres comprising 2 components, the component with the lower m.p. forming a sheath around the other component.

The fibrous mass can be a knitted, woven or non-woven fabric, esp. comprising spot- or zone-bonded short staple fibres or oriented conjugate fibres. The oleophilic particles are esp. of silica surface-treated with silane, they prefer an av. particle size of $\geq 0.1 \mu$. 11.3.75 as 028724 (clg. 11.3.74-GB-010687) B01d-17/04 (26.11.79) IMPERIAL CHEM. Purificn. of industrial waste water contg. organic impurities - by contacting with adsorbent polymer material in solvated gel state
CIBA GEIGY AG 17.06.75-CH-007846
A88 F06 (28.02.79) *BE-843-000 C02c-05/02

Purificn. of industrial waste-waters, esp. from the textile, paper, leather and dye industries, is effected by contacting the water with an adsorbant polymer material in a solvated gel state.

Effects rapid, efficient purification of a wide range of industrial waste-waters. Practically 100% of the impurities can be eliminated. The treated water can be recycled. A wide range of adsorbant polymers can be used. The treatment also removes anionic, cationic and nonionic surfactants.

Purificn. is effected at 0-100 esp. 10-70°C, using a fixed bed process. The polymer material pref. consists of a hydrated gel of a polymer having a mol. wt. 500 and a specific surface 30 m²/g. The polymer is pref. a synthetic thermoplast in the form of spun fibres having a thickness of 0.2-20 denier. The fibres are combined to form a cable cut into pieces having a length of 1-10mm, or converted into a sheet. The thermoplast is pref. a polyamide, an anionically modified polyamide, a linear-polyester, a linear polyester modified with an acid, or esp. an acrylonitrile (co)polymer.

Removing suspended impurities from water by flocculation - using water-soluble copolymer of glycerol 1,3 di:chlorohydrin and hexa:methylene-di:amine

TASHK POLY 09.11.77-SU-540864

A97 (08.04.79) C02b-01/20 C02c-05/02

Suspended matter can be removed from drinking and waste water by treating it with a water-soluble flocculating agent. An improved degree of purificn. can be achieved if the previous reagent, polyacrylamide, is replaced by a copolymer of 1,3-dichlorohydrin of glycerol and hexamethylene-diamine used in an amt. of 0.05-2.5 mg/l.

The polyacrylamide was not effective at pH less than 7 or in water contg. less than 1000 mg/l solids, whereas the improved reagent with clean water contg. 50-300,000 mg/l solids. The flocculating agent is added in the form of a 0.1-0.2% aq. soln., using doses of 0.25-0.8, 0.8-1.5 and 1.5-2.5 mg/l. respectively for water contg. solids in the concn. ranges 50-200, 200-1000 and 1000-300,000 mg/l respectively. The mixt. is stirred for 1 min. allowed to stand for 15 min. to settle, and the solids are removed by the usual methods.

Water contg. 450 mg/l solids was purified to a level of 20 mg/l., and that contg. 5800 mg/l to 8-12 mg/l compared to final levels of 50 and 20-30 mg/l respectively obtd. by the previous method.

Drying and pelletising sewage - by passing it, with hot air, through rotating louvered drum with adjustable length central pelletising section

CANNON LTD 30.10.78-US-956139 (19.09.77-US-834735)

C04 Q76 (11.12.79) F26b-03/04

Sewage is pelletised by feeding it into a rotating louvered drum with spaced longitudinal louvres and a central pelletising section, passing air at 500-800°F. through the inlet section louvres and through the drum at 200-400 ft./min., and passing cooling air through the outlet section louvres.

In the central section the louvres are closed to form a cylindrical rolling surface. The starting material is pref. pre-dried to a moisture content of 15%, the heating air is at 550°F. cooling is with ambient air, and the prod. has a moisture content of <10%. The louvres are pref. closed by rows of hinged baffles or by telescoping cylinders. A similar system is claimed in the parent patent. 30.10.78 as 956139 Div.ex. 4137029 (13pp1358)

Dewatering aq. slurry of fine particles - esp. tailings from coal washing plant, with solids discharge controlled by signal proportional to attenuation of radiation beam

AMERICAN MINECHEM 15.03.78-US-886709 (10.11.75-US-630214)

J01 (11.12.79) B01d-21/*C02b-01/20

A method of dewatering an aq. slurry of fine solid particles comprises adding to the slurry a flocculant lyophobic to water and lyophilic to fine solid particles. The mixt. is charged to a thickener to separate water from the mixture by settling flocculated solids to form a mixt. having solids content ≥35%.

A radiation beam is passed across the flow of flocculated solids and the emergent beam is detected. An electrical signal is produced proportional to the beam intensity and this is used to regulate the discharge of the flocculated solids. The discharged solids are passed through a foraminous conduit while being vibrated to remove water.

The method is used for dewatering the tailings from a coal washing plant. 15.3.78 as 886709 (10pp295)

 Plasmid(s) contg. DNA fragment attached to operon - for transformation into host bacterium on yeast to produce nutrient proteins, esp. ovalbumin from *E. coli* (NL 11.12.79)
 INST PASTEUR 08.06.78-FR-017221
 (13.12.79) A23j-01 C07g-07 C12k-01 C12k-03

The novel plasmid contains, in a part non-essential to its life cycle, a DNA fragment derived from a λ -phage. This DNA fragment (insertion) is attached to one part of a bacterial operon (esp. a lactose operon) which contains at least the bacterial promoter and, attached to this promoter, a structure gene fragment (e.g. the Z-gene which codes for the formation of β -galactosidase in the lactose operon).

The insertion is opt. restricted to the first nucleotide triplet(s) which code for the first amino acid(s) of the corresp. protein i.e. β -galactosidase in the case of the lactose operon. The plasmid also contains, in the structure gene fragment, a point of intersection for a specific endonuclease such as EcoRI, and pref. no more characteristic sequences for the same endonuclease in any other part.

The DNA fragments, after insertion in a suitable vector (plasmid) and transformation in a host cell lead to the formation of prokaryotic and eukaryotic proteins. This is used to produce nutrient proteins from a bacterium or yeast and is esp. suitable for the prodn. of ovalbumin from *E. coli*. The process is not possible with natural genes. The DNA fragments are considerably larger than the previously produced synthetic somatostatin genes. The process is economical and the greater part of the protein formed is composed of the desired protein fragments. 7.6.79 as 923297 (28pp1401)

 Machine to size grade and trim dry mushrooms - sorts sizes via divergent conveyor bands and trims stalks to equal lengths
 PERUFFO A 02.02.79-IT-085510 (09.03.78-IT-085534)
 (09.11.79) A23n-15

In a size-grading section of the machine, mushrooms are received on a set of spaced conveyor bands which diverge progressively. Smaller mushrooms drop between the bands as larger mushrooms are carried further until they can drop through the bands. The falling mushrooms land on a transfer conveyor running at right angles to the size grading bands. The transfer conveyor comprises spaced pairs of cables and a prod. orientator to set the mushroom stalks between cables which support the underside of the mushroom head.

While held in the cables of the transfer conveyor, each mushroom is presented to a first trimming saw, which removes the tip of the stalk, and then to a second trimming saw. The second saw equalises the stalk lengths of all similarly sized mushrooms carried between a pair of cables. The prod. orientator pref. comprises a conveyor. In addition, one of each pair of cables is held temporarily lower than the other just downstream of the brushes.

The mushrooms are sized and trimmed in the dry state and require no further treatment prior to distribution. In each size category the mushrooms have stalks trimmed to a common length. 7.3.79 as 005864 (19pp448)

 Enzyme immobilisation carrier - comprises porous anion exchanger bearing diethylamino-ethyl gp.
 SUMITOMO CHEMICAL KK 30.01.78-GB-003731
 A96B04 (19.12.79) C07g-07/02 C08f-08/32 C08j-09/36

The enzyme-immobilisation carrier comprises a porous synthetic anion-exchange resin bearing a diethylaminoethyl gp. The resin has a specific surface area of ≥ 1 square metre/g. (dry basis) and the total vol. of pores of size 100-2000Å is ≥ 0.1 ml/g. (dry basis).

The carrier when used to immobilise enzymes gives products with high activity, good activity retentivity and a high enzyme combining capacity, so that they can be used repeatedly and continuously in homogeneous reactions in batch systems. A very wide range of enzymes can be immo-

bilised with the carrier.

Pref. the resin has specific surface area of ≥ 5 square metres/g. an av. pore size of 150-1000Å, and a total vol. of 100-2000Å pores of ≥ 0.2 ml/g. The resin may contain other anion exchange gps. as well as $\text{Et}_2\text{NC}_2\text{H}_4$ gps. 30.1.78 as 993731 (18pp1248)

 Antibiotics S 54832 from *Micromonospora globosa* NRRL 11299 - useful against gram positive bacteria, mycoplasmas and neisseriae
 SANDOZ LTD 08.01.79-CH-000131 (08.06.78-CH-006282)
 B04 C03 (19.12.79) A61k-35/70 C12d-09/14

Antibiotics S54832/A-I, A-II, A-III and A-IV are new. They all have characteristic i.r. and u.v. spectra. A-I is a light yellow solid; $[\alpha]_D^{20} + 118.7^\circ$ (C, 1.14 in pyridine); analysing for C 50.2, H 4.2, N 13.1, O 21.7, S 11.3%; with an equivalent wt. of 1521. A-II is a light yellow solid; analysing for (1) C 48.5, H 3.8, N 12.4% and (2) C 50.3, H 4.3, N 12.4, O 21.7, S 12%; with a characteristic p.n.m.r. spectrum. A-III is a light yellow solid; analysing for C 48.1, H 4.1, N 12.3%. A-IV is a light yellow solid; $[\alpha]_D^{20} + 153.2^\circ$ (C, 0.752 in pyridine), analysing for C 49, H 4, N 12.7, O 21.8, S 11.6%.

Micromonospora globosa NRRL 11299 (also ATCC 31465) is a new strain isolated from a Spanish soil sample in a rice field. It is identified by morphological and cultural characteristics. NRRL 11299 is cultured in a nutrient medium and the resulting antibiotic is extracted with solvent. The 4 components are sep'd. by repeated chromatography.

A-I to A-IV are active against a wide range of Gram-positive bacteria, mycoplasma and neisseriae, and so are useful as therapeutic agents, as animal feed additives etc. Dose is 10-3500mg daily. 4.6.79 as 019474 (22pp1248)

B05 (28.11.79) *DT2528-984 A61k-31/19 C07c-101/44 C12d-13
Bestatin (I) is a new cpd. which inhibits aminopeptidase B. leucine aminopeptidase and bleomycin hydrolase and has the following properties, soluble in water MeOH and EtOH insoluble in ethyl acetate, ether and petroleum ether, $\alpha/\alpha^{22}_D = -15.1^\circ$ ($c \approx 0.861$, MeOH), positive Rydon-Smith and ninhydrin reaction negative Sakaguchi reaction. Acidic salts of (I) are also new.

On account of its inhibition of bleomycin hydrolase, (I) can be used as a synergist for bleomycin in the inhibition of tumours.

(I) esp. squamous cell carcinomas. (I) is also useful in the analysis of biological functions and disease processes. 1.7.74 as 075090, C12d-13/00, A61k-31/19, C07c-101/44 (28.11.79) MICROBIAL CHEM. RES. INST. (11pp) (J51007187)

A novel antibiotic SF-1346 - produced by *Streptomyces chibaensis*
MEIJI CONFECTIONARY 28.08.72-JA-085292
B04 (28.11.79) *J49041-595 + A61k-31/44 C07d-213/65 C12d-09/14

A novel antibiotic, SF-1346, is produced from *Streptomyces chibaensis* SF-1346 (FERM-P 1523), SF-1246 has mol. formula of C₈H₁₀N₂O₃, m.p. of 260-261° (decomp) and α/α^{22}_D of 30° (H₂O). It is soln. in aq. HCl alk. H₂O, H₂O, and MeOH, hardly soln. in EtOH and insol. in EtOAc, CHCl₃, C₆H₆, and petroleum ether, and coloured reddish-brown and brin in ninhydrin and FeCl₃ reactions, resp. Rf on cellulose thin layer chromatog. (BuOH-HOAc-H₂O = 4:1:5) is 0.28.

Inhibitory zones against growths of *Bacillus subtilis*, *coli*, and *Piricularia sasakii* are 40, 20, and 70 mm. resp. tested by paper disc method (10 mg/ml). It is also effective against rice blast disease. UV and IR absorption spectra are presented. In an example *S. chibaensis* SF-1346 was aerobically cultured in a medium (pH 7.0) contg. millet jelly 4.0, soybean powder 2.0 sol. vegetable protein 0.5 Pharma-media 1.0, soybean oil 0.3, FeSO₄ 0.001 NiCl₂ 0.0001 and CoCl₂ 0.0001% at 28° for 72 hr. The culture filtrate (pH 3) was passed through a column of Dowex 50 W x 2 (H⁺). SF-1346 was eluted with 1 N NH₄OH. adsorbed on active C. and eluted with 10% Me₂CO. It was crystd. from the conc. left at 5° overnight, 4.9g from 17 l. 28.8.72 as 085292, C12d-9/14, A61k-31/44, C07d-213/65 (28.11.79) MEIJI CONFECTIONARY CO. (5pp) (J49041595)

Microporous element with tapered penetrations in each layer - induces flow of fluid through element without additional driving energy and without osmosis effect

DEUTSCH D H 14.05.79-US-038586 (30.05.78-US-910110)
J01 (04.12.79) B01d-13/04 B01d-31 B01d-39 B01d-53/22

Microporous element comprises ≥3 bonded layers, each layer contg. tapered, hollow penetrations. The larger ends of the hollow penetrations all terminate in one face whilst the narrower ends terminate in the opposite face, adjoining layers being so oriented that all the penetrations taper in the same direction. A fluid passing through the element passes through ≤10 x 10⁶ hollows in sequence.

Depending on the application, the total thickness of the composite element lies between 0.001 microns and 100 cms., whilst the average distance between adjacent pores across the surface of a layer is between 0.001 and 100 microns. The construction of the element is such that a gas of liq. in which the element is placed is caused to flow through the element without the use of any additional energy and without the necessity of a difference in concn. across the element creating an osmosis effect.

Element will induce the flow of the fluid for which it is constructed without the use of additional energy. It is partic. useful for cleaning the gaseous discharge from a chimney, inducing an atmosphere change in a biological reaction vessel without permitting the passage of liquid, or inducing the flow of a liq. in a reaction system. 30.5.79 as 004243 (19pp1370)

Flowline mutagenic activity tester for chemical cpds. - has output from control to packaging unit connected to process unit at input to mixer and recorder for greater productivity

CHEM CPDS BIOL TEST 07.12.76-SU-430244
B04 (30.03.79) C12k-01

The known mutagenic activity tester for chemical cpds. contains a control, bacterial medium, agar medium prepn. unit and a process unit. In order to increase productivity and expand capability by recording the state of the cpds. a packaging unit with as many containers as cpds. is introduced along with a recorder, mixer and with a colony counter in the process unit. More than 50,000 cpds. can be tested, annually and new medicinal forms can be sought by flowline testing.

 Selection of heifers according to milk yield - based on desoxyribonucleic acid content of skin sweat gland cell nuclei determination
 LIVESTOCK RES INST 03.02.77-SU-448808
 B04 C03 P14 (05.04.79) A01k-67
 Heifers histological skin tissue cells tests are used to select animals as possible high yield milk producers. The accuracy of selective method is increased by the determination of desoxyribonucleic acid content of sweat gland cell nuclei in test animals. The DNA content is estimated by means of cytoseptrophotometry of tissue samples and comparing results with known milk producers. High DNA content indicates that the test animal in a future high yield milk producer.

 Specific lung cell reactions to Mycoplasma pneumoniae infection is achieved by reinjecting the lung tissue and

cultivating in a test medium at 36-37°C. Thus guinea pigs are injected with the live culture of M. pneumoniae with strictly controlled culture medium.

After 50-60 days the lung is removed, cutting off test sections under strictly controlled and sterilized conditions. Then the samples are inoculated again and cultivated for 5-7 days in a test medium at 36-37°C, maintaining constant pH of 7.2-7.4. The samples are periodically tested.

Such arrangement allows local cell immunity investigation and could be used for live vaccine safety testing.

 MASSACHUSETTS INST TECH 17.03.78-US-880036 (07.03.77-US-775156)
 B02 (11.12.79) C12d-09

Cephalosporin antibiotic is produced by contacting a cell-free extract of cephalosporin acremonium with a substrate of the formula (I) under conditions promoting oxygen transfer and in the presence of ATP as energy source.

R = (1-4C) hydrocarbyl terminally substd. by carboxy and/or amino. The exact structure of the product is not known.

The cell-free extracts of C. acremonium may be obtd. from the strains ATCC 20339 and ATCC 14553. The ATP is preferably used in combination with an ATP generating system which is a phosphate donor and a phosphotransferase enzyme. This is preferably phosphoenolpyruvate and pyruvate kinase.

The process gives cephalosporin antibiotics, without fermentation or laboratory synthesis. 17.3.78 as 880036 (7pp916)

B04 K08 R16 (11.12.79) A61k-43 G01n-33/16

Immunoassay for determ. of presence of microbial antibodies in mammalian serum involves providing a reaction mixt. of buffered aq. medium, serum sample, antigen from the virus or microbes and anti-antibody to the serum to be tested. The anti-antibody bears a detectable label. The vol. ratio of anti-antibody to serum sample is adjusted to a value where an agglutinate is formed but it is less than the value required to effect pptn. of an antigen-antibody conjugate. The reaction mixt. is incubated at 4-45° for 24-2 hrs. at pH 6.5-8.5 so that an antigen-antibody conjugate can form. The level of the label is determined as a measure of the conjugate.

Yield of label is at a maximum, so that the sensitivity of determ. of the microbial antibodies is improved. Useful as a diagnostic screen in detecting infection by e.g. rubella, *N. gonorrhoeae*, *N. meningitidis*, *T. pallidum*, *Strep. pyogenes*, *Histoplasma capsulatum*, *C. albicans*, *T. vaginalis* etc. 15.3.78 as 886849 (6pp1248)

Oligosaccharide mixt. contg. oligoglucosyl fructose is prepd. by first liquefying and hydrolysing a 5-45 wt. % starch suspension with alpha-amylase or an enzyme splitting alpha-1, 6-glucoside linkages. To the hydrolysate is added 0.2-5 (1/3-3) times the amt. of crude sugar and/or fructose, pref. invert sugar or honey. The resulting mixt. is treated at pH 5-7 and 40-90°C with an alpha-amylase obtd. from *Bacillus subtilis*, *Endomycopsis*, fungus, pancreas or saliva.

The mixt. is a valuable sweetening agent. 24.2.71 as 08748 (4pp068)

BRBL ★ D17 91271B/51 ★ DT 2825-080
Dust feed back system for beet cutting dryer - returns dust to dried cuttings on elevator by gravity

BRAUNSCHWEIG MASCH 08.06.78-DT-825080
(13.12.79) C11d-01/12 C13c-03

In the conveyor line between the dust hopper of a dryer for sugar beet cuttings and an elevator, a cell wheel is positioned, and some distance below the opening of the chute into the elevator, there is an air inlet with an adjustable flap. Between the dust hopper and the cell wheel, the conveyor is a worm, whilst between the cell wheel and the elevator it is an inclined pipe.

The arrangement efficiently ensures the return of the dust to the dried cuttings.

The advantages of a simple dust conveyor are combined with those of an uncomplicated and inexpensive dust recirculating system. 8.6.78 as 825080 (8pp1045)

MASW ★ D17 91294B/51 ★ DT 2825-504
Enlarged capacity diffusion column esp. for sugar beet - has additional feeders ensuring continuous cleaning of sieve bottom

MASCH BUCKAU R WOLF 10.06.78-DT-825504 (00.00.72-DT-243168)
(13.12.79) B01d-11/02 C13d-01/08

The parent patent describes a diffusion column for swilling out liquors, esp. the juice from sugar beet cuttings in counter-current, formed by a vertical cylindrical tube in which a centre tube is positioned concentrically. The central tube carries a rotary cutting distributor beneath which a sieve

bottom is cleaned constantly.

A pump delivers the mash of beet cuttings through a channel to the distributor, the front edge of which is formed by a number of slide shoes resting on the sieve bottom. The central tube has, at its bottom end a plate, beneath which, there is, supported coaxially, a shaft journal in a bearing in the bottom housing.

The improvement is that the opening through which the shaft journal passes has two or more channels in the housing provided with guide plates. Each mash channel in the housing has a flanged connection, which for pref. is connected to the main mash feed pipeline by pipe bends, each of which offers the same resistance to the flow.

The new arrangement ensures that behind each mash distributor the surface of the sieve is kept clear and the most efficient draining of the juice is achieved. 10.6.78 as 825504 (12pp1045)

Washing particulate feedstock esp. starch in hydrocyclones - arranged as multistage enclosed system with partial final stage recycling

WESSANEN UK LTD 24.05.78-GB-022187

P41 (13.12.79) *EP--5-651 B03b-05/34 C08b-31 + C13k-01/08
D/S: N(CH, DT, GB, JA, I.U, OE, SW, SU).

In a multistage enclosed system for upgrading particulate feedstock, contaminating material is removed by wash liquid fed countercurrent to the feedstock. Pumps are positioned between stages and in the final stage a controlled portion of the underflow stream is returned to the inlet side of the pump which feeds this final stage.

The regulation of the amount of recycled liquid round the final stage is controlled by a calibrated orifice disc or a metering pump. Pref. all stages are operated under identical conditions and pref. include identical multi-hydrocyclones. Pref. the recycled portion is 15 to 40% of the vol. of the final stage underflow.

The appts. washes contaminating material from corn starch or potato starch. The recycling of the final stage creates in it working conditions similar to the other stages. This increases the removal of contaminants; reduces the amt. of wash water consumed; reduces the number of hydrocyclones needed in a stage, typically to 74; and reduces power consumption. 23.5.79 as GB0073(28pp295).

P15 (13.12.79) *DT2019-369 A24b-09

The humidity of the dried tobacco on a drying conveyor is measured, and depending upon the measured value of the humidity, the heat content of the first and the second heating media are regulated. The first heating medium is blown in countercurrent in the form of a hot gas, through the material on the conveyor. The second medium heats indirectly through the dryer walls, and the heat content of the one medium is regulated with reference to the heat content of the other.

A control device is thus provided which is as cheap as possible and by which short term as well as long term variations of the inlet humidity are reduced to a required constant output value, without an excessively long convey-or being necessary. 22.4.70 as 019369 (8pp1045)

Permanent waving agent for human hair contains as active components 3-15 wt. % cystein and 0.2-3 wt. % N-acetylcystein, based on total wt. of agent. Pref. the N-acetylcyst-ein is ≥ 10 wt. % of the cystein, and the two components

combined constitute 4-10 wt. % of the agent. The agent has a pH 7-10.

The agent can be used for hot or cold waving, and is free of prior art disadvantages e.g. skin allergic reactions, sp-litting of hair, damage to roots, fall-out, decolouration, deposition of cystein crystals on scalp, or during storage. The material is also cheap to produce. 18.4.77 as 717002 (5pp913)

KAMM/ ★ D21 91296B/51 ★ DT 2825-529
Mfg. pieces of floating soap - by bonding porous open cell plastic wafer to one side

KAMMER M 10.06.78-DT-825529

A97 (13.12.79) C11d-17/02

A piece of soap or other washing medium is joined at one end to a wafer, made of a plastic foam with a closed cell structure. On the side towards the soap, the wafer carries grooves, recesses and/or webs to improve the adhesion. On the free side, the wafer has a fine granular texture or fine grooves so it cannot slip on slightly inclined surfaces.

The complete piece of soap has thus a specific gravity of < 1 and will float on the water in a bath tub. The grain-ed underside can be used to massage the skin. A piece of soap can be used up, without wastage, to the last remnant. 10.6.78 as 825529 (6pp39)

SHIS ★ D21 91322B/51 ★ DT 2854-109
Thixotropic nail varnish with stable viscosity - contains gel prepd. from swollen organic modified montmorillonite, plasticised nitrocellulose and solvents (NL 11.12.79)

SHISEIDO KK 08.06.78-JA-069087

A96 E17 G02 (A11 A25 A82) (13.12.79) A61k-07/04

Thixotropic nail varnish contains a gel, dispersed as gel former, with (1) 10-30 (wt. %) chip mass, produced from (A) 25-70% organic modified montmorillonite clay, (B) 5-70% nitrocellulose and (C) 5-30% substance which can swell (A) and plasticise (B) under the action of heat and pressure, and (2) 70-90% organic solvent mixt.

The viscosity is stabilised about a week after mfr. of the varnish and does not continue to rise, so that even the last traces in a bottle can be used. Specifically, there is no need to use aromatic hydrocarbon solvents, e.g. toluene or xylene, which tend to cause embrittlement of the nail and other problems in time. 14.12.78 as 854109 (34pp016)

Implement for cleaning a person's teeth and/or esp. for removing food particles from between the teeth, comprises a carrier thread covered by flocking with radially extending bristles. The thread is flock-covered with bristles only zone-wise, its flock-free sections being at least partly coated with a wax.

Both the thread and the bristles are suitably made of a polyamide, at least part of the latter being coated with a dentifrice or a disinfectant. All components of the article may be coloured. For the flocking of the thread with the bristles, a physiologically acceptable adhesive is used. An acrylate may be suitable. The thread is polyamide-6,6 (7 dtex) and the bristles are 0.7 mm long. 5.6.79 as 922824 (11pp267)

MINN ★ D21 91399B/51 ★DT 2922-932
Oligomeric methacrylated siloxane prepolymer used in dental filler - is produced from purified methacrylated alkyl trialkoxy-silane free from inhibitor

MINNESOTA MINING CO 02.06.78-US-911892
A96 E11 (A14 A26) (13.12.79) A61k-05/06 C07f-07/21

Oligomeric methacrylated siloxane prepolymer (I) has the structure (in which each m independently is 1, 2 or 3. p = 2-10. Q is CH₂=CMeCO-X (CR₂)_n-. X is O, S or NR. The R gps. independently are H or max. 2R gps. can be 1-2 C alkyl. n = 3-12).

Q is CH₂=CMeCO-X (CR₂)_n-. X is O, S or NR. The R gps. independently are H or max. 2R gps. can be 1-2 C alkyl. n = 3-12).

Pure methacrylated alkyl-trialkoxysilane cpds. (II), which are used in the prodn. of (I) by hydrolysis and have the formula CH₂=CMe-CO-X-(CH₂)_n-Si(OR')₃ (in which R' is unsubst. 1-4C alkyl), are colourless and free from initiators (sic - inhibitors in text and examples) are also specified. When approx. equal amts. to which 1.5 wt. % benzoyl peroxide (III) and 3.0 wt. % N, N-bis-(hydroxyethyl)-p-toluidine (IV) have been added, are mixed thoroughly, an exothermic reaction with a substantial (at least 5-fold) increase in viscosity or solidification takes place within 20 mins. at ambient temp.

(I) is specified for use in dental filler compsns. It forms stable pastes, which can be polymerised by addn. of free radical initiators or by UV light after addn. of a photocatalyst and accelerator. 1.6.79 as 922932 (26pp)

Hair conditioning article contg. conditioner - and soluble salt in separate coatings on flexible substrate

PROCTER & GAMBLE CO 06.06.78-US-913139
E37 (E12) (19.12.79) A61k-07/06

Hair conditioning article comprises a flexible substrate having a first releasable coating of 0.3-15 (1.5-3)g/sq.m. of water-soluble salt (I) and second releasable coating of 1.5-20 (6-15)g/sq.m. of a normally-solid hair conditioner

(I) is ≥ 1 of (a) Na, K, NH₄ or Mg halides, sulphates, (acid) phosphates, borates, acetates, formates or benzoates; (b) Al hydroxychloride or sulphate; (c) Zr oxychlor sulphate or hydroxychloride; or (d) Mn acetate, MnSO₂ or MnCl₂.

The substrate is paper or (non)woven cloth (esp. non-woven cloth) and has size 7x10 to 50x80 cm. Pref. (I) is KCl or NaCl and the conditioner is esp. ditallow dimethylammonium chloride (II).

When hair (pref. still wet after shampooing) is rubbed with the particle, combing, detangling, static fly-away, softness and manageability are improved. These devices are more convenient than liq. viruses and allow the conditioner to be applied exactly where needed. 5.6.79 as 919629 (10pp1251)

OSOL ★ D21 91643B/51 ★J5 4143-529
Aerosol shaving foam compsn. - prepd. by use of oleic acid as fatty acid component, giving stable foam at low temps.

OSAKA AEROSOL KOGYO KK 27.04.78-JA-049218
E17 (08.11.79) A61k-07/15

New aerosol shaving foam compsn. is obt'd. by incorporating 0.5-7.0 wt. % of oleic acid as the fatty acid component in the soln. to be foamed during its prepn. By replacing fatty acid component such as palmitic, stearic, myristic acid, etc. in the soln. to be foamed partly or wholly with oleic acid, an aerosol which can provide stable foam at low temp. (0-10°C) can be obt'd. not only when using triethanolamine, but also when KOH or NaOH as saponifying agent.

Apart from the fatty acid component, the aerosol can be prepd. as usual. Pref. oleic acid is incorporated in an amt. of 0.5-7.0wt. %, pref. 1.0-5.0 wt. % in the soln. to be foamed, but oleic acid-soap forms a little weak foam. This problem can be overcome by using oleic acid together with stearic acid and myristic acid. Thereby the foam of stearic acid-soap and myristic acid-soap can also be improved. 27.4.78 as 049218(5pp5)

LIOC ★ D21 91644B/51 ★J5 4143-530
Oral compsn. for preventing tooth decay - contains poly(meth)acrylic acid opt. in alkali metal salt form

LION DENTIFRICE KK 26.04.78-JA-049634
A96 B05 (08.11.79) A61k-07/16

Oral compsn. contains 0.005-0.5 wt. % of polyacrylic acid polymethacrylic acid or one of their alkali metal salts in the free state, and has pH 5-10. Compsn. is in a pastry or solid form and has a good texture. Thus it can be favourably used in dentifrice, troche, plaster, fluoride gel, etc.

A 0.0025 wt. % Na polyacrylate soln. prevents decay more effectively than a 0.005 wt. % chlorohexylidene soln. 26.4.78 as 049634(9pp5)

DAIL ★ D21 91916B/51 ★J5 4145-22

Hair shaving method reducing pseudofolliculitis barbae comprising applying di:methyl polysiloxane fluid coated razor to water-wetted skin

RUCKER J 08.08.75-US-603145

A96 P62 (A26) (11.12.79) A61k-07/15 B26d-07/08

Shaving method comprises washing the skin clean and wet with water to provide a first colourless transparent first liq. phase over the skin area from which the hair is to be shaved, spreading a drop of water-immiscible fluid consisting of dimethyl polysiloxanes of viscosity 600-700 cs. across the length of the razor edge to produce a further colourless, transparent liq. phase repellent to the first, and moving the razor edge across the wet skin area.

A sharply defined low frictional interface is created between the two liq. phases, so that the razor edge slides smoothly across the skin and cuts cleanly close to the skin with minimal pull on the hair and frictional resistance between the skin and razor edge. The need of shaving cream and soaps is eliminated and the shaved area can be viewed during the act. The method reduces the problem of pseudofolliculitis barbae. 8.8.75 as 603145 (4pp558)

Insect control in wood - by impregnating with aq. soln. contg. boron cpd., and an amine

TOWA MOKUZAI KK (YAMA-DAIL) 28.04.78-JA-051767

C03 E19 F09 P63 (E36) (08.11.79) B27k-03/02

Method comprises impregnating an aq. soln. contg. boron cpd. (e.g. boric acid) and amine with the molar proportion of 1:0.1-3 and treating it through (a) the restoration of pressure and/or the loading of pressure or (b) drying.

By combining (e.g. alkylamine, alkanolamine, polyvalent amine, cyclic amine, etc.) boric acid can be easily dissolved in water to the prescribed concn. in a short time and the soln. can be kept liq. at above -2°C. Thus the contact of the solution and wood can be practised at normal temp. Further the amine-boric acid compsn. shows strong affinity to water and can be easily impregnated in wood rapidly. Thus the method can be adapted for the wood having moisture content as low as above 25 wt.%. Practically the amine-boric acid solution having boric acid concn. 10-30 w/w% can be used and pH of the soln. is previously adjusted to 7-7.5 with acid. 28.4.78 as 051767 (9pp5)

HISM ★ D22 91635B/51 ★J5 4143-517
Cataplast of good softness and adherence - contains uncured elastic block copolymer water-in oil type emulsion and active component

HISAMITSU PHARM KK 28.04.78-JA-051908

A96 B07 (08.11.79) A61k-09/70

Cataplast (I) is prepd. by using as base ingredients A-B-A type uncured elastic block copolymer and W/O type emulsion and adding a pharmacologically active component there-to. A is e.g. styrene and B is butadiene.

Various disadvantages of known cataplasts including weak stickiness of cataplast to skin due to low viscosity, low adhesion and bad softness can be overcome by (I). (I) can be preserved at low temp. below 0°C for along time without losing softness. 28.4.78 as 051908 (9pp104)

ENCL-★ D22 91645B/51 ★J5 4143-531

Prefilling sterilisation of milk containers with bactericidal aerosol - produced by ultrasonic atomisation of liq. for entrainment in air current

EX-CELL-O CORP 16.05.78-US-906159

P34 + P42 (D13) (13.12.79) *BE-876-292 + A61k-01 A61l-03
A61m-11/06 B05b-13/02 B05b-17/06

R/S: N(DK,JA) + E(DT,FR,GB,SW).

A predetermined vol. of a bactericidal liq. is contained in a nebulising chamber. The chamber is fitted with a piezo-electric crystal oscillator which produces ultrasonic vibration atomising the surface of the liq. to fine particles. Compressed air is piped into the chamber to pass over the liq. surface, entrain the particles and form an aerosol. The aerosol is piped to a nozzle which is directed into the container to be sterilised.

The chamber outlet for aerosol is pref. located centrally just above the surface level of liq. The chamber inlet

for compressed air is above the aerosol outlet level. The liq. level in the chamber is pref. maintained automatically by controlled make up from a supply reservoir. The chamber is pref. provided with a liq. overflow outlet and a low-level cutout.

The rate at which liq. is atomised is pref. controllable and can be monitored by a photo-electric sensor on the nozzle feed pipe. The nozzle is pref. heated e.g. by warm air or electrically.

Used for fitting to a filling machine to sterilise containers to be filled with homogenised milk, skimmed milk, butter, egg-based drinks etc.

Optimum mixt. of liq. in carrier gas is obtd. Continuous control of aerosol concn. is achieved. Very fine atomisation of liq. is obtd. with no danger of droplet agglomeration in the nozzle.

N-acylamino acid derivs. for cation surface activators - having antistatic and sterilising properties

AJINOMOTO KK 08.05.78-JA-054240

E19 (14.11.79) C07c-103/37 C07c-149/23 C07d-209/20

N-acylamino acid derivs. of formula $R_1\text{CON}(\text{X})\text{Y}-\text{CONH}(\text{CH}_2)_n\text{NR}_2\text{R}_3$ (I) are new. In (I), R_1 is 7-17C aliphatic hydrocarbonyl; X is methyl; Y is $-\text{CH}_2\text{CH}_2$ or $-\text{C}(\text{R}_4)\text{H}$; R_4 is H, 1-4C alkyl, benzyl, (I), (II), $-\text{CH}_2\text{OH}$, $-\text{O}(\text{OH})\text{HCH}_3$, $-\text{CH}_2\text{SH}$, $-\text{CH}_2\text{CH}_2\text{SCH}_3$, $-(\text{CH}_2)_m\text{CONH}(\text{CH}_2)_k\text{NR}_2\text{R}_3$ or $-(\text{CH}_2)_n\text{NH}-\text{OR}_1$; m and k are each 2 or 3; R_3 and R_2 are each H, $-\text{CH}_3$ or $-\text{CH}_2\text{CH}_2\text{OH}$; and n is 3 or 4.

(I) provide the cation surface activators having flexibility, antistatic property, sterilising property and having only slight

skin-irritation. Specifically (I) are prepd. by condensing N-acylamino acid lower alkyl $R_1\text{CON}(\text{X})-\text{Y}-\text{COOR}_5$ (II) where R_5 is 1-5C alkyl) and substd. diamines of formula $\text{H}_2\text{N}-(\text{CH}_2)_k\text{NR}_2\text{R}_3$ (III) in solvents such as benzene or hexane. 8.5.78 as 054240(8pp136)

N-acylamino acid aminoalkylamide cationic surfactant mfr. - by condensing N-acylamino acid alkyl ester and a di:amine

AJINOMOTO KK 08.05.78-JA-054241

E16 (14.11.79) A61k-07/06 C07c-102/06 C07c-103/50 C11d-01/38

N-Long chain acylamino acid aminoalkylamides (I) are produced by condensing N-long chain acylamino acid lower alkyl esters and diamines of formula $\text{H}_2\text{N}-(\text{CH}_2)_k\text{NR}_1\text{R}_2$ (II) where k is 2 or 3; R_1 - R_2 are H, $-\text{CH}_3$ or $-\text{CH}_2\text{CH}_2\text{OH}$.

(I) is white crystal soluble in water, alcohols, acetic esters and aromatic hydrocarbons. When the cpd. is dissolved in water or acid aq. soln. the amine portion of the molecule of the cpd. is converted to ammonium type and is used as cation surfactant.

The cation surfactant act mildly on the skin and have excellent flexibility, penetrating power, sterilising property. 8.5.78 as 054241(7pp136)

Aqueous liquid detergent composition - based on surface active nonionic alkylene oxide adducts-phosphoric ester-salts

BEROL KEMI AB (BERO-) 25.11.74-SW-014792

A97 E19 (30.03.79) *BE-835-803 C11d-01/34

Compsn. for washing textiles contains as surface-active agent a mixt. of a nonionogenic surfactant with an alkyl phosphate. The compsn. also contains a complex-forming cpd. and additives. The washing ability of the compsn. and its stability are improved by using as a surface-active agent a 30:70 to 70:30 (by wt.) mixt. of a nonionogenic surfactant and alkyl phosphate. The nonionogenic surfactant has pref. the formula $RO(A)_xH$ (in which R is 8-24C alkyl; A is an oxyalkylene gp.; X = 5-50). The alkyl phosphate has pref. the formula $(R'O)_yPO(OM)_3-y$ (in which R' is 9-11 C alkyl; y = 1-2; M is a monovalent cation). The compsn. contains (in wt.%) the surface-active agent 0.5-35, a complex-forming cpd. 5-35, the remainder is additive.

Fabric care compsn. - contg. smectite clay, gelatinised vegetable starch and opt. water

PROCTER & GAMBLE CO 13.03.78-US-885933

(11.12.79) *EP-4-111 D06m-13

Novel fabric care compsns. comprise (a) 0.5-75% smectite clay; (b) 1-90% gelatinised vegetable starch; and (c) 0-98% water. The clay is an alkali(ne earth) metal montmorillonite, saponite and/or hectorite and has an ion exchange capacity of ≥ 50 meq. per 100 g.

Pref. components are at 0.5-15, 1-15 and 50-98% resp. Pref. compsns. also contain 10-30% surfactant(s), and pref. also 0.25-8% cationic quat. ammonium anti-static and/or fabric softener. 13.3.78 as 885933 (7pp974)

COLG D25 69975B/39 = US 4178-255
Detergent compsn. for washing powder contg. meta-kaolin - and quat. ammonium cpd.; plus meta-kaolin textile softening compsn.

COLGATE PALMOLIVE CO 15.05.78-US-905718

E33 (E16) (11.12.79) *BE-876-231 D06m-13/50

A detergent compsn. comprises a surface active detergent (I) and metakaolin in a ratio of 1: ≥ 0.8 . Pref. the compsn. also contains a builder salt and a quaternary ammonium

softening agent, and (I) is an anionic detergent, the compsn. comprising 10-20% anionic surfactant, 20-35% builder salt, 12-20% metakaolin and 3-6% quaternary ammonium softening agent.

The addition of the metakaolin gives some fabric-softening effect and good detergency. 15.5.78 as 905718 (6pp9)

BADI ★ D25 92632B/51 ★ US 4178-2
Spotting-agent compsn. for use in laundering garments - con-
nonionic surfactant obtd. from fatty alcohol(s), ethylene oxide a
propylene oxide, together with isoparaffinic solvent
BASF WYANDOTTE CORP 22.08.77-US-826512 (23.03.77-US-
780557)

E17 (11.12.79) C11d-07/50

Spotting-agent compsn. consists of a soln. of (1) 10 wt. of nonionic surfactant (I) in (2) an isoparaffinic solvent consisting of a mixt. of isoparaffins contg. an average of 11-14C. (I) is the prod. of reacting a mixt. of 10-18C fatty alcohols (with the proviso that the proportion of such alcohols contg. $\geq 17C$ is ≥ 20 wt.%) with a mixt. comprising 50-70% ethylene oxide and 30-50% propylene oxide, the mixt. of alkylene oxides comprising 57-68 wt.% of the total fatty alcohols plus alkylene oxides.

Compsn. uses less fatty alcohols than known sp. ttin compsns. and has improved detergency. The Parent Pat. claimed a method of spotting and laundering a garment contg. organic soil on part of it, by applying the above compsn. and then laundering. 22.8.77 as 826512 Div. ex. 4093418 (5pp927)

AQOR D25 11212T/07 = US 4178-30
Sepn. of sulphonic acids - from solns also contg. sulphuric water and unsulphonated hydrocarbons

ATO CHIMIE (SNPA) 07.08.70-FR-029211

E17 H08 (11.12.79) *BE-771-038 C07c-143/02 + C07b-13

Sepn. of sulphonic acids in an untreated paraffin sulphonic soln. also contg. H_2SO_4 , H_2O and non-sulphonated paraffins is claimed. Process comprises (a) mixing with the soln. ≥ 1 slightly polar solvent selected from alkanones, cycloalkanones, (cyclo)aliphatic ethers, (cyclo)alkyl alkanoates, alkylcycloalkanoates, and aliphatic ketoesters contg. $\geq 5C$, having a solubility in H_2O of < 7 wt.%, which forms an azeotrope with H_2O , thus producing a mixt. of an organic phase (contg. paraffin sulphonic acids) and an aq. phase (contg. H_2SO_4); (b) sepg. the 2 phases; (c) neutralising organic phase with alkali(ne earth) metal hydroxides or carbonates or alkaline earth oxides to give sulphonates, the ratio amt. of H_2O to slightly polar solvent in neutralised phase being at most equal to the corresp. ratio for the azeotrope which forms between them; (d) removing the volatiles from neutralised phase to recover sulphonates under temp. and pressure such that they are in molten state.

Useful in detergent mfr. 12.4.78 as 895549 (+4.8.71; 18.9.74; 29.12.75; 13.10.76-US-169145; 507246; 645092; 732120) (5pp963)

Stabilisation of sodium percarbonate particles against moisture - b
adding water mixing with silicic acid and drying

DEUTSCHE GOLD & SILBER 31.10.77-DT-748783

E34 (11.12.79) *BE-871-633 C01b-15/10

Process for stabilising sodium percarbonate particles to moisture comprises mixing particles, having a water content of 1-10% with dry highly dispersed silica and drying to give particles having a surrounding protective jacket of sodium silicate. The silica is pref. pyrogenic silica, in amt. 0.05-5 (esp. 10) wt.% with an average particle size of 2-100 (7-20) μ .

The method is simple and effective, resulting in efficient coating of the particles. This would not result if the sodium percarbonate was dry, since in the drying stage of the present process, water evaporates from the particle surfaces depositing sodium silicate. 16.10.78 as 951461 (3pp977)

CPI INDEXES

ALERTING PATENTEE INDEX (III)

Weekly by section and overall, lists all current patents in patentee code order and, within a given patentee, in earliest priority date order. The first line gives patentee code, earliest priority date, patentee name, CPI classes and finally the current patent number. The second line gives the first part of the title, followed by the accession number.

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

Pretzel steeping machine - with fixed loading and liquor application
and detachable oven charging screen belts
DRAUTZ R 13.06.78-DT-825772
(20.12.79) A21b-05/06 A21c-09/04

Steeping machine consists of three endless nylon screen belts of equal width in series. The first is a loading belt, and the second is a transport belt above which an overflow trough for the liquor is mounted. These two are fixed to the machine but the third which is used to charge the oven is detachable.

This subdivision prevents liquor vapours from entering the oven. The screen structure causes the pretzels to be wetted on the underside as well. The machine is simple to manufacture and to operate. 13.6.78 as 825772(31pp39)

REVI- ★ D11 00282C/01 ★ FR 2419-677
Bakery oven loading conveyor with easily removable rollers - is freely rotatable on spindles which can be dropped out of support frame
USINA REVISIONS MEC 13.03.78-FR-007140
(16.11.79) A21b-03/07

The loader is of the type comprising a rectangular frame with the longer side members carry-frame with the longer side members carrying transverse, freely-rotatable, parallel, end rollers. An endless conveyor band passes around the end rollers to carry the loaves. An intermediate, support roller to carry the frame along the oven floor is also fitted between the longer side members.

At least one of the three rollers is a tube rotating freely on a coaxial spindle extending between the side members. A coaxial bore in each end of the spindle has a dia. equal to that of an opposed bore in the adjacent side member so that a gudgeon pin can simultaneously engage both bores with an interference fit. The length of the gudgeon pin is such that it can be pushed into the spindle bore, pref. completely in, to an extent that its outer end is clear of the bore in the side-member. This allows the roller to be dropped out of the frame.

Rollers and/or roller supports can be exchanged easily and rapidly with minimum loss of prodn. time. The design is hygienic and the assembly easily cleaned. 13.3.78 as 007140 (13pp448)

CHAR/ ★ D11 00283C/01 ★ FR 2419-678
Industrial feeder for slices of bread into toasting oven - transfers prod. from slicer in formation retained through oven conveyor
CHARPENTIER Y LG 17.03.78-FR-007854
(16.11.79) A21b-03/07

The installation is of the type in which loaves are passed through a slicer to produce regular slices in rows which are arranged alongside each other on an accumula-

ting table. The rows are then advanced longitudinally into the oven. The improvement is that advancing of the rows into the oven is effected via a feeder comprising a dead-plate rising at 5-30° to the oven entry an overheated paddle conveyor pushes the stacks up the feeder dead-plate.

The feeder conveyor pref. comprises pivoted paddles fitted on endless chains and actuated by cam guides. The accumulating table is pref. horizontally aligned with the slicer discharge to receive rows of slices delivered transversely. The filled, accumulating table then pref. tilts to align its surface with the feeder dead-plate. A push-bar conveyor is pref. used to transfer all rows simultaneously longitudinally from the accumulating table on to the feeder dead plate.

The rows of slicers are maintained scrupulously in distinct rows from which individual slices are peeled off successively on to the oven conveyor. Slices are correctly spaced without side overlap or doubles, so satisfactory toasting is assured with minimum waste. 17.3.78 as 007854 (18pp448)

Wheat gluten quality determination - by weighing sample, placing it in magnetic field and passing high-frequency emission to determine spin-lattice relaxation time
AS UKR PLANT PHYSIO 21.11.77-SU-546568
R16 (20.04.79) G01n-33/10

Method for determining the quality of wheat gluten, for use in verifying the technological properties of wheat in the flour-milling and bread-baking industries, etc., by measuring the physical characteristics.

The analysis is speeded up, while retaining the wholeness and germinating power of the wheat, by placing the grain into a magnetic field and passing pulses of high-frequency emission through. The spin-lattice relaxation time is used as the physical characteristic.

Grodzinskii, D.M., Lutsishina, E.G., Kostromina, N.A. Bul. 14/15.4.79. 21.1.77 as 546568 (2pp29)

Prod. of whole wheat food esp. breakfast cereal - includes a chilling step to reduce tempering period required
NABISCO INC 03.05.78-US-902448
(18.12.79) *GB2020-160 A23I-01/16

A whole wheat food prod. is mfd. by cooking a mixt. of water and whole wheat to provide a coated whole wheat contg. 28-55 wt. % of moisture; and holding the cooked prod. for 0-12 hrs. at ambient temp. and pressure.

The cooked whole wheat is then chilled to 1-12°C to temper the wheat, the temp. chosen such that as the duration of the holding step is increased from 0-12 hrs., the chilling temp. is proportionately increased from 1-12°C. The chilled tempered whole wheat is shaped to its desired configuration, then baked or toasted.

The reduction of the time in the tempering process permits a corresp. reduction of storage capacity and associated equipment, resulting in a simpler, more manageable and efficient mfg. sequence. 3.5.78 as 902448 (3pp931)

Measuring meat tenderness by determining trace element concn. - e.g. iron and zinc in muscle of beef carcass
SATTERLEE LD 21.02.77-CA-272177
R16 (11.12.79) G01n-23/22

Meat tenderness is evaluated by measuring the concentration of at least two trace elements in the meat. These concentrations are introduced into a formula which yields the meat tenderness. Preferably the trace elements are iron and zinc and their concentrations are measured in a muscle of a beef carcass.

The formula for tenderness is determined by applying multiple regression analysis to determine the appropriate coeffs for known values of tenderness determined by subjective tasting. Pref. the formula includes a term which is the ratio of concn of iron to zinc. 21.2.77 as 272177 (38pp285)

Chopped beef discs possessing high cohesion for roasting - are prepared from mixed lean and fat meat then firmly pressed
CORONEOS JH 19.06.78-US-917077
P28 (20.12.79) A22c-07 A47j-37/04

A method of preparing beef meatballs or discs for roasting on a vertical spit is described. A mixt. of very lean and partly fat meat is chosen, some of the fat is then removed; the meat is then chopped fine, ground fine and reground. The meat is then spread out and a prepared mixture of additives (spices etc.) is thoroughly mixed with it.

A mould is then prepared, from a base, a cardboard disc and a plastic or waxed paper sheet for subsequent wrapping of the meat; a cylindrical side wall is placed on the base and the inside of the mould is lubricated with edible oil; the meat is then packed in to fill the mould and a pressing disc is applied, using considerable pressure on a level mechanism; the underside of this disc has a convex curvature.

A square-section tube is then passed down through a guide on the top of the disc and penetrates fully through the meat slab to reach the bottom of the mould; a square-section bar is used for this purpose, then subsequently withdrawn.

After pressing, the pressing plate is removed, the cylindrical wall is lifted off by the handles, and the waxed paper or plastic sheet is wrapped around the slab of meat. The slab is then lifted off on the cardboard disc and taken to a freezing plant. 5.5.79 as 918253 (23pp236)

Butchers powered cleaver to split animal carcass partic. pig - projects cleaving blade by release of motor loaded spring
CABUT A 14.03.78-FR-008067
(16.11.79) A22b-05/20

The cleaver a hand-held housing from which a cleaving blade projects through a slot in which the blade can reciprocate. Inside the housing, the blade extends from a block mounted to slide up and down on guide pillars. A retractable catch on the block engages a motor-driven continuous chain which lifts the block from its lowest position. The block is lifted against the resistance of a compression spring. As the block nears the top of its stroke the catch is automatically released from the chain. The block is then projected down by the loaded spring to provide a cutting stroke of the blade.

The housing pref. has a pistol grip handle with trigger switch to actuates the chain motor. Displacement of the trigger pref. also adjusts the force with which the block is returned to its lowest position by advancing or delaying the release of the catch. The housing is pref. suspended from a counterbalancing hoist to facilitate manipulation of the cleaver.

The reduction of manual effort greatly increases the productive capacity of a single worker. 14.3.78 as 008067 (12pp448)

Prepn. of edible collagen casings e.g. for sausages - by extruding acid-swelled collagen dispersion in alkaline conc. salt soln. for forming tube, and hardening in the soln.
NITTA GELATIN KK 13.05.78-JA-056802
(19.11.79) A22c-13

The method comprises extruding acid-swelled collagen dispersion in an alkaline concd. salt soln. contg. aldehyde for forming collagen tube and immersing the tube successively in the soln. for hardening.

The formation of collagen tube, its coagulation and its hardening can be practiced in the same soln. and collagen (sausage) casings excellent in water resisting property, heat resistance and processing property, can be prepared by a simple process.

The alkaline conc. salt soln. pref. contains a salt showing dehydrating and coagulating activity on collagen (e.g. sodium chloride, ammonium sulphate, sodium sulphate etc.) having pH 9-11. As aldehyde an aldehyde which is reactive with collagen (e.g. formalin, glyoxal, glutaraldehyde, etc.) can be used. Directly after the formation of tube, the tube is in acidic condition and the salt is little adhered to the tube. Thus aldehyde can be absorbed well on the tube and during the immersion collagen and aldehyde react gradually with pH rise and proceeding of dehydration. As the result water resistible tube can be obtained. 13.5.78 as 056802 (2pp5)

Extractor for the cloac(s) of fowl carcasses - has rotary cylindrical knife enclosing centralising spindle and spiral hook

MEYN P 29.06.76-NL-007089

(17.12.79) *NL7607-089 A22c-21/06

A rotary cutter is used to cut around the anus of a slaughtered fowl prior to the removal of the innards. The cutter is equipped with a centring pin which is inserted into the anus and has a spiral thread. After insertion, the pin is rotated through a limited angle which then holds the anus still against the rotation of the cutter. After the cut, the pin is then rotated in the opposite direction whilst the anus is prevented from rotating with it by a spring loaded frictional element.

The use of this centering pin and spiral grip is more hygienic than the traditional vacuum grip device which could cause damage to the wall of the duct. The cutter is also preferably equipped with a spacer bar which ensures that, regardless of the size of the bird, the pin is inserted to the correct depth. 29.6.76 as 007089 (7pp1370)

Treatment of sauerkraut mfr. effluent - to reduce acidity, by fermentation using suitable yeast
CHRIST C 14.06.78-FR-017753
(D15) (28.12.79) C02c-05/10
Residual brine from sauerkraut mfr. is treated to give a waste suitable for disposal in standard urban sewers by the action of a microorganism which degrades lactic acid and reduces (sic; raises) the pH to a value close to neutral. Suitable organisms include Candida tropicalis, C. utilis, Saccharomyces exiguus, S. urevisiae, or Hansenula anomala.
The appts. required comprises at least one vat, fitted with a perforated pipe inside near the bottom, through

which air is fed. The brine is seeded with yeast, Liq. contg. yeast rising to the top of the vat is drawn off, and led to a decantation tank. The supernatant from this is drawn off for disposal and the yeast slurry which collects at the bottom is returned to the vat.

The process can be carried out on a small scale, requires little capital investment, and is suitable for small sauerkraut factories. 25.4.79 as 014443 (4pp955)

Low mol. wt. chitosan prodn. - by treating chitosan, obtd. by deacetylating natural chitin, with hydrogen peroxide soln. at pH 6-12

NIPPON SUISAN KAISHA 15.05.78-JA-057441

A11 B04 (21.11.79) C08b-37/08

Low mole. wt. chitosan is produced by treating chitosan obtd. by deacetylating natural chitin with 0.007-0.35% of H_2O_2 soln. adjusted to pH 6-12. Chitosan having selected mol. wt. is obtd. without side reactions such as colouring. The glucoside bond of high molecular chitosan is cleaved selectively without any effect on the amino gp. thereof. The desired mol. wt. is obtd. by controlling the reaction time.

Specifically chitosan is dispersed in water and adjusted to pH 6-12, pref. 9-11.5, and heated to desired temp. with stirring. The H_2O_2 soln. is added to the dispersion in one or several portions. The reaction time is 2-5 hrs. The reaction temp. is 20-90 (pref. 30-70)°C. After the reaction, the low mol. wt. chitosan is water-washed, dried and pulverised.

As the H_2O_2 soln. used is cheap and safe, the prod. can be used for intermediate treatment of foods or for cosmetics and medicines. 15.5.78 as 057441(5pp136)

Protein fibres are continuously produced from an aqueous dispersion of proteinaceous material with a solids content of 0.5-35 wt. % and pH < 6.0 . The dispersion is passed under pressure of ≥ 3.5 atmos. and at $115-158^\circ\text{C}$ through a tubular heat exchanger for a sufficient time to form the fibres. The mass is then passed through a back-pressure creating orifice with one or more openings and the fibres separated.

The direction of exit of the fibre-containing dispersion from the orifice is confined to a conical zone of apex angle $4-90^\circ$, whose axis is perpendicular to the orifice. As the fibre-containing dispersion enters the conical zone, it is mixed with a basic aqueous solution so that the pH is adjusted to 6.0-7.0.

Process is used for producing meat-like products from vegetable proteins e.g. soya, suitable for extending meat. Max. fibre yield is achieved by controlling the pH. 10.12.76 as 013739 (5pp913)

Prepn. of 5,6-isopropylidene-l-ascorbic acid 2 phosphate ester(s) - from the acid, pyridine, potassium hydroxide and phosphorus oxychloride

KANSAS STATE UNIV 01.06.78-US-911669 (06.05.76-US-683888)
B03 E13 (18.12.79) C07f-09/09

Prepn. of 5,6-isopropylidene-L-ascorbic acid 2-phosphate esters (I) involves mixing the free acid with pyridine and alkali metal hydroxide to pH 12-13 in aq. soln. The acid is at 0.3-0.6 M and pyridine at 1.5-3 M. Then POCl₃ is added at -10 to 10°C, and additional amts. of POCl₃ and hydroxide are added to maintain pH 12-13 throughout the reaction so that (I) is obtd.

(I) are obtd. in high yields and of analytical purity for use as vitamin C additives in food systems or vitamin pre-mixes without deactivation because of decompsn. in presence of oxygen or under high temp. conditions. 1.6.78 as 911669 (+21.7.77-US-817555) (9pp1248)

P43 Q35 (20.12.79) A23n-15/02 B07b-13/10 B65g-47/12

The potatoes are charged halfway up an inclined conveyor belt which carries cross bars, coated with rubber or plastic. As the potatoes roll downward, they lose the buds which are light enough to be carried to the top pulley for discharge in a bunker.

The spacing of the cross bars is smaller than the average size of a potato. A blade mounted above the top discharge end prevents any accidental carry-over of potatoes.

This saves the manual labour for presorting the potatoes, removing the clusters and the buds. Clogging of screens is eliminated and the potatoes can be packaged automatically. 16.6.78 as 826385(9pp280)

Fruit is peeled in a machine which grips the fruit along its stem-blossom axis and rotates it whilst a cutting element mounted on a swinging arm moves across the surface of the fruit removing the peel. The position of the cutting organ is continuously modified to suit irregularities in the contour of the fruit surface.

This traditional installation is modified by incorporating two cutters mounted on arms fixed in relation to each other at an angle of 90°. One cutter starts at the middle of the fruit moving through an arc of 90° to one end whilst the other cutter starts at the opposite end and moves towards the middle. The fruit is peeled in half the time taken by the traditional machine. 24.10.75 as 012480 Div.ex.

Sorting agricultural products - using rapid temp. changes and radiation heat sensor to detect damaged prods.

AGRIC ELECTRIF (VEND) 19.09.77-SU-534272

P43 (25.04.79) A23n-15 B07c-05/34

The sorting biological objects, pref. agricultural prods. includes feeding them piecemeal through a device which measures their radiation heat compares the resulting signal with a given signal, and feeding the resulting signal into an executive mechanism.

The sorting effectiveness is increased, by carrying out

instantaneous cooling of the objects after the heat-treatment until a difference is achieved between the sound and defective objects of 4-10°C. The heat-treatment is carried out over a period of 1-10 mins.

The method is based on living cell adoptability to rapid temp. changes, with dead cells (i.e. damaged prod.) detected by rapid heat loss.

Sewage aeration system - with cylindrical element revolving on vertical shaft above bubble releasing ring

PASSAVANTW MICHELbacher 11.05.78-DT-820692

(20.12.79) B01f-03/04 C02c-01/12

System is based on conducting ascending bubbles along a revolving vertical element which produces a thin laminar flow with a high radial velocity gradient. The laminar flow continues over the full height of the element.

A revolving cylinder on a vertical shaft has a cone at the bottom which guides the air bubbles along its surface. Its top can be closed or open. The bubbles are produced in perforations of a ring to which compressed air is supplied through a pipe.

The velocity gradient produces an inverse pressure gradient so that the bubbles adhere to the element as they rise to the surface. Their path is thereby lengthened and they are broken up into finer bubbles. 11.5.78 as 820692 (19pp39)

A system for the purification of waste water containing oil or petrol from garages or car repair shops includes a changeover valve which is operated jointly with a hot water or steam valve. The normal gravity settling trap is thereby replaced by an emulsion separation plant.

When hot water or steam has turned the effluent into an emulsion, the normal traps are unable to purify the effluent. The new system remedies this. 15.6.78 as 826281 (15pp)

MERE ★ D15 00150C/01 ★DT 2826-664
Poly:cyclic aromatic hydrocarbon(s), e.g. 3,4 benzpyrene, determ. - by thin layer chromatography on silicon dioxide hydrophobised silica gel plates

MERCK PATENT GMBH 19.06.78-DT-826664

E14 J04 R16 (20.12.79) G01n-31/08

In the semiquantitative determination of polycyclic aromatic hydrocarbons by thin-layer chromatographic (TLC) sep. of a soln. of the hydrocarbons on a coated carrier, (A) the specimen to be examined is applied to a carrier containing (1) a concn. zone consisting of a synthetically produced porous SiO₂ of medium pore vol. with a pore width of 2-15 μm and (2) a sepn. zone consisting of a silica gel layer

15: WATER TREATMENT	-p. 11	Week C01	D15
with a surface modified by reaction of the coated carrier with a methyl-alkyl-dichlorosilane (the alkyl group being -20°C), and (b) subsequently eluting with an organic solvent or solvent mixt. Used for detection/determination of polycyclic hydrocarbons such as the carcinogen 3,4-benzpyrene in e.g. waters such as waste waters, surface waters, ground water or drinking water. The hydrophobic nature of the epg. zone prevents absorption of water from the air and premature activation of the adsorbent. This improves the reproducibility of results. Flow-rate through the carrier is high, since the soln. experiences no resistance at the interface between the concn. and sepn. zones. 19.6.78 as 26664(18pp280)			organisms and chemicals and have high water permeability, e.g. $1-10^5$ l/hr. atmos m^2. 22.5.79 as 920762(30pp200)
JUDO- ★ D15 00151C/01 ★DT 2826-702 water softener with two ion exchange columns - one column becoming exhausted at full flow while other is regenerated JUDO WASSERAUFBER 19.06.78-DT-826702 (20.12.79) C02b-01/64 drinking water softener comprises two columns containing ion exchange resin, operated alternately, the column not in operation being flushed through and regenerated with salt solution. The valves for switching over from one column to the other are operated as a function of the measured water throughput or hardness level. The softened water is supplied to a blender, where it is mixed with untreated drinking water. The softener columns are so designed that, when the maximum flow rate passes through one column, its ion exchange resin becomes exhausted after approximately the same time required for the resin in the other column to be regenerated and sterilised. Typically, at this maximum flow rate, the distance traversed by the water through resin is insufficient for complete softening and the blending ratio at the blender may then be adjusted accordingly. A common multiple valve may be used for switching over between both columns. Quantity of resin required can be reduced by a factor of 10. 19.6.78 as 826702(24pp236)			CHEM- ★ D15 00221C/01 ★DT 2923-718 Organo-phosphonic acid scale inhibitors - contg. copolymer of styrene sulphonic acid and maleic acid or anhydride CHEMED CORP 15.06.78-US-915713 A97 E11 (20.12.79) C02b-05/06 Scale inhibitor additives for use in aq. media contain (a) a water-soluble organophosphonic acid or its water-soluble salt and (b) a copolymer of styrenesulphonic acid (SSA) and maleic acid or anhydride, or a water-soluble salt of this copolymer. The additives are esp. useful for inhibiting scale formation in steam boilers, esp. when the feed water contains scale-forming Fe salts. The effect of components (a) and (b) is synergistic. Component (a) is pref. of formula $\text{H}_2\text{O}_3\text{P}-(\text{CR}_1\text{R}_2)_m-\text{PO}_3\text{H}_2$, $\text{H}_2\text{O}_3\text{P}-\text{CR}_3(\text{NH}_2)-\text{PO}_3\text{H}_2$ or $(\text{H}_2\text{O}_3\text{PCH}_2)_2\text{N}-\text{R}'-\text{N}(\text{CH}_2\text{PO}_3\text{H}_2)_2$ (where $m=1-10$; each R_1 is independently H or 1-4C alkyl; each R_2 is independently H, OH or 1-4C alkyl; R_3 is 1-10C alkyl, PhCH_2 or Ph; R' is 1-10C alkylene), esp. 1-hydroxyethylidene-1,1-diphosphonic acid (HEDP). 12.6.79 as 923718(17pp367)
			CIBA ★ D15 00224C/01 ★DT 2923-794 Cyanuric acid removal from waste waters - by microbiological degradation with Sporothrix fungus CIBA GEIGY AG 15.06.78-CH-006532 C02 E13 (20.12.79) C02c-05/10 Microbiological degradation of cyanuric acid (I) in waste waters is effected by contacting under aerobic conditions with a fungus of the genus Sporothrix. The process is esp. useful for treating waste waters from the mfr. of triazine herbicides. The Sporothrix fungi are capable of degrading (I) at a rate of 20-30 mg/g.hr., which is much higher than the rates achievable with prior art microorganisms (≤ 2.5 mg/g.hr.). 12.6.79 as 923794(16pp367)
SOLS ★ D15 00161C/01 ★DT 2826-798 solar panel contg. desalination plant - has fan blowing steam from zigzag water collector chambers through condenser VOLKSWAGENWERK AG 19.06.78-DT-826798 J01 Q74 (20.12.79) F24j-03/02 The solar heating system which can be adopted to obtain drinking water from salt water, uses a pipe forming a coil through which the water travels along a zig-zag path. Alternatively the coil can be formed from two sheets joined together and shaped to give the zigzag path. The coil can be shaped for mounting on a sloping roof. Each leg of the coil can have a raised partition at the end region forming a weir behind which the water can collect or overflow into the next leg. Steam which forms above the water is blown through the coil by a fan to pass into a condenser coil, and circulate around a closer circuit. 19.6.78 as 826798(11pp349)			AGRO- ★ D15 00256C/01 ★DT 2924-169 Biological sewage treatment with sludge sepn. by fluid filtration - and bubbles collected from sepn. chamber to prevent flotation effect (NL 18.12.79) AGROTECHNIKA NP 15.06.78-CS-003924 (20.12.79) C02c-01/06 A biological sewage treatment plant operates by sepg. the activated sludge by fluid filtration, the sludge being automatically recycled into the activation chamber; the sepn. chamber is mounted above the activation chamber. Above the communicating opening through which the effluent from the activation chamber ascends into the separation chamber, there is a bubble collector in the form of a hollow chamber with an open bottom and a gas escape pipe leading upwards away from its closed top and outside the separation chamber. The projected area of the open bottom of the bubble collector is greater than that of the communicating opening. Pref. the bubble collector diverges downwards. The flotation effect, by which sludge tends to accumulate and float on the surface of the separation chamber, is prevented. Thus the efficiency of the plant is improved. 15.6.79 as 924169(12pp236)

Appts. for magnetic treatment of liquids - with liq. diverted through gap between magnetic poles

STRUTT AGENCIES LTD 21.03.79-GB-009965 (30.05.78-GB-023912)

(28.12.79) C02b-09

Appts. for subjecting a liq. to a magnetic flux includes a flow path for the liq. from an inlet to an outlet. Two magnetic poles are disposed so that lines of magnetic flux passing between them traverse the flow path. The first magnetic pole is sensitive to contact with the liq. and a protective sheet is used to cover this pole. The two magnetic poles may be sized and contoured to focus the magnetic flux.

Appts. is used to magnetically treat a liq. e.g. water in a circulation system. 21.3.79 as 009965 (7pp295)

GOOD/ ★ D15 00350C/01 ★GB 2023-122
Biological treatment of waste water - by fluidising upward flow through particulate bed with partial recycling of flow

GOODSON M G 15.06.79-GB-020944 (19.06.78-GB-027274)

(28.12.79) C02c-01/04

In a biological treatment of waste water, the water is passed upwardly through a bed of particulate matter which it fluidises. The water is withdrawn at a constant rate from a first region near the upper surface of the fluidised bed and is returned to a second region of the fluidised bed situated at a lower level than the first region.

Pref. the waste water is introduced into the fluidised bed at a level intermediate the first and second regions. Pref. air or oxygen is added to the water withdrawn from the first region prior to introduction to the second region.

The method can be used for the simultaneous nitrification and denitrification of waste water as well as removal of carbonaceous matter. 15.6.79 as 020944 (10pp295)

APVC ★ D15 00361C/01 ★GB 2023-180
Plate heat exchanger with plates as anode for chlorine generation - from saline heat exchange media to prevent marine fouling of the plates

APV CO LTD 13.06.79-GB-020551 (13.06.78-GB-026770)

C03 E36 J08 Q78 (J03) (28.12.79) C23f-14 F28f-19

Plate heat exchanger comprises a separable pack of gasketed plates of corrosion resistant metal and electrodes for electrolytically generating chlorine from sea-water or brackish water used as the heat exchange media. The chlorine generated inhibits the growth of marine organisms in the system. The plates themselves can be the anodes so that the chlorine is generated on the heat exchange surfaces themselves and the cathode is a rod electrode at the inlet duct for the heat exchange media.

Fouling of the plates is prevented without resorting to the use of a high copper alloy as the plate material, a metal not well suited to heat exchangers. 13.6.79 as 020551 (4pp916)

Recovering ice crystals from aq. slurry - by washing in vertical column with homogenising blades

DOUWE EGBERTS KON 22.06.79-GB-021808 (23.06.78-GB-027792)

(03.01.80) C02b-01/12

Ice crystals are sep'd. from a slurry of an aq. soln. by passing them up a vertical tube as a packed bed. While the bed is advanced it is washed by liq. introduced at the top of the column to form a stable wash front in a horizontal plane which lies within the bed. Aq. soln. is drained from the bed beneath the stagnant wash front.

Tilted vanes are rotated by an axial shaft and advance the crushed ice vertically. Pref. the aq. soln. is removed by a perforated section of the vanes. The vanes also serve to homogenise the porosity of the ice bed throughout its cross-section. A disintegrator is located at the top of the vertical tube to recover the washed ice crystals.

The vanes homogenise the porosity to prevent channel forming in the ice bed. This reduces the loss of wash liq. 22.6.79 as 021808 (10pp295)

HITF ★ D15 00525C/01 ★J5 4146-27
Evaporator for fresh water prodn. from sea water - has a tube-contg. column, a dehumidifier, vapour compressor and load sensor

HITACHI SHIPBLD ENGG KK 09.05.78-JA-055153

(15.11.79) B01d-01/28 B01d-03/42 C02b-01/04

The appts. comprises an evaporation column including a number of vertical heat exchange tubes, a dehumidifier, vapour compressor for compressing the vapour generated from the bottom of the column and before the dehumidifier vapour enters the hollow space between the tubes, and a load sensor to detect increase in power requirement for the compressor.

When an increase in water output is detected in connection with detected power increase, the temp. of the inlet brine to the evaporator is lowered. When an increase in the compressor ratio is detected, a scale removing agent is added to the brine. 9.5.78 as 055153 (5pp47)

Prodn. of slaked lime for treating waste water - by calcining limestone to give blocks contg. uncalcined limestone and impurities, forming a powder and slaking with water

YOTSUYA J 09.05.78-JA-054604

(15.11.79) C01f-11/02 C02b-01/30 C02c-05/02

The method comprises calcining limestone to give calcined lime blocks contg. impurities and uncalcined limestone, providing the blocks to obtain a minute powder and slaking the powder.

The presence of uncalcined limestone and silicic acid impurities improves the settling properties of waste water. The slaked lime is used as a neutralising, aggregating or setting agent for treating excrement, drainage water or waste industrial water.

In an example, a limestone material was calcined to obtain calcined lime blocks of 5-30 mm. The blocks were divided to obtain a minute powder of about 40 mesh, which was slaked with water. The slaked lime contained uncalcined lime stone and silicic acid impurities. 9.5.78 as 54604(2pp51)

TAKE ★ D15 00550C/01 ★ J5 4146-455
Removing phosphoric ion from aq. soln. - by acidifying and contacting with hydrated zirconium oxide, which is regenerated with alkali

TAKEDA CHEMICAL IND KK 04.05.78-JA-053408
(15.11.79) B01d-15 C02b-01/14 C02c-05/02

Phosphoric ion is effectively and economically removed by adsorption from aq. soln. contg. it without formation of sludge by previously adjusting its pH to 1.5-5.5 (2-4.7), and subsequently contacting it with zirconium oxide of formula: $ZrO_2 \cdot nH_2O$, where n is 0.5-2.0, e.g. $ZrO_2 \cdot H_2O$ ($ZrO(OH)_2$), $ZrO_2 \cdot 2H_2O$ ($Zr(OH)_4$), $ZrO_2 \cdot nH_2O$ ($n=1.5-2.0$) etc. so as to be adsorbed thereon.

Desorption of phosphoric ion and regeneration of zirconium oxide are simultaneously easily carried-out by contacting it with aq. alkali soln., e.g. contg. NaOH, Na_2CO_3 , H_4OH , KOH or $(NH_4)_2CO_3$ etc. in amt. of 1-30 wt. % at pH, esp. >10 without any dissolution of zirconium oxide.

This process is most preferably carried-out when the concn. of phosphoric ion is 1-10000 ppm., and carried-out excellently even in the presence of other ions, e.g. F^- , SO_4^{2-} , chromate ion, Cl^- , $Cr_2O_7^{2-}$, NO_3^- , ClO_4^- , MnO_4^{2-} , CO_3^{2-} and $R-COO^-$ etc. 4.5.78 as 053408(5pp34)

IDE ★ D15 00551C/01 ★ J5 4146-458
Treating waste water contg. higher valent metals - using absorbency of higher valent metal in cell to control amt. of reductant added, where photomultiplier controls supply pump for reagent

NIPPON ELECTRIC KK 08.05.78-JA-054624
(15.11.79) C02c-05/02

In treatment of waste water contg. higher-valent metal ion, e.g. Cr^{6+} etc. by adjusting its pH value, adding a reducing agent, e.g. iron powder, $FeSO_4$, Na_2SO_3 and NaH CO_3 etc. to convert the higher-valent metal ion into lower-valent metal ion, e.g. Cr^{3+} etc., followed by sepn. by coagulation sedimentation, the improvement comprises detecting absorbency of the higher-valent metal ion, i.e. Cr^{6+} at a wavelength of around 350 nm using a cell having the width of pref. ≥ 5 cm, and controlling the amt. of the reducing agent to be added by controlling a pump for the reducing agent by power of photomultiplier due to the fact that the power of the photomultiplier is in proportion to the amt. of Cr^{6+} existing in the cell, so that it becomes possible to carry out economical treatment of the waste water without using excess amt. of the reducing agent. This process is also applicable for removal of Cd or V etc. from water. 8.5.78 as 054624(3pp34)

 Dispersing polymers in water treatment systems - after admixing nonionic surfactants sodium carbonate, chelating agents and filler

CHEMED CORP 27.03.75-CA-223363

A97 (30.11.79) *DT2543-135 B01d-21/* C02b-01/20 C02c-03 C02c-05/02

Process for dispersing high mol. wt. polymers in water-treatment systems takes place by admixing the polymers, before dispersion, with a combination of a nonionic surfactant Na_2CO_3 , a chelating agent and a filler. The process is used for flocculating waste- and other service-waters, e.g. for dewatering and coagulating sludge.

The nonionionic surfactants admixed to polymer form a film which delays wetting of polymer particles and improves sepn. into small particles which do not tend to bake together. Na_2CO_3 ensures alkalinity of soln. and presence of polymer as water-soluble alkali salts.

Polyphosphate chelating agent prevents reaction of Ca- and Mg water hardeners with polymer. Fillers, e.g. Na_2SO_4 , controls moisture uptake. 14.10.75 as 123740 (clg. 27.3.75-CA-223363) C02b-1/20, C02c-5/02, 3/00, B01d-21/01 (30.11.79) CHEMED CORP. (3pp) (J51111759)

A liquid such as a salt soln. is distilled in a multistage evapn. process in which the pressure in each successive stage is lower than that in the preceding stage. The incoming liquid is passed through coils in each stage in the counterflow direction to that of the evaporating fluid so that the coils serve to preheat the liquid and act as condensing surfaces for the vapour.

In order to optimise the heat transfer at the condensor surface, a proportion of the vapour produced in each stage is allowed to expand and flow into the next stage. This measure reduces the size of the appts. and improves the efficiency with which the uncondensable vapour is removed from the installation. 14.11.69 as 017166 (4pp) (1370)

R25 + Q63 Q66 (17.12.79) *BE-796-193 + F16k-31/04

A timing device used with a water softening installation is equipped with a motor mounted on a plate and a series of gears by means of which a crank arm is driven which operates the plunger of a metering pump. The drive gear for the crank has a cut-out on its periphery which coincides in the rest position with a drive pinion on the motor so that normally the motor which runs continuously is not driving the metering plunger. Once every 24 hours the

pinion engages with the drive gear so that the plunger executes one complete stroke.

The motor plate can rotate through a limited angle under the influence of a pin on the timing wheel pushing against a cam surface on the mounting plate, the movement of the plate being limited by the action of a spring. This rotation releases a locking device on the plunger drive gear which then undergoes a small rotation which engages it with the motor drive pinion. 1.3.73 as 002879 (10pp1370)

Magnetic processor for aqueous system - has permanent magnet with coil connected to thyristor converter contg. controls, triggers and phase changers

ZHIVOV LG 30.08.76-SU-399348

P41 (18.04.79) B03c-01/08

Earlier system for processing of aqueous systems contained a wound permanent magnet, a system for field strength regulation and a pipe within the magnet gap. Now to widen the range of the magnetic field strength and to increase productivity, by preventing ferromagnetic particles being attracted to the poles, the magnet coil is connected to a thyristor converter to change the polarity of the magnet.

The proposed system is useful in mining chemistry, metallurgy and heat engineering for descaling boilers and clarifying suspensions.

Any ferromagnetic particles in the aqueous system are attracted by the magnet poles. To prevent them sticking there, the coil is switched on at a voltage which for a definite time changes its polarity. For this, the outputs of the triggers are connected to control windings of magnetic amplifiers in the controls.

Pump mounted on raft with pipe - pivotable from vertical operating position to horizontal position for ease of installation
AIDE R J 21.06.77-US-808457
Q56 (18.12.79) B01f-03/04 F04b-21

A pump is used to transfer water from the bottom of a lake to the top. The pump includes a raft formed of floats mounted at spaced intervals. An elongated pipe is mounted on the raft and extends downwardly. A wind-driven shaft is mounted on the pipe with a propeller on the lower end of the shaft positioned within the top of the pipe. Rotation of the shaft by the wind rotates the propeller to draw water up the pipe.

The pipe is pivotally mounted at its upper end to the raft to pivot about a horizontal axis from the vertical position to a horizontal position when it is positioned between two of the spaced floats. There is a lock for securing the pipe in its vertical position. The pivoting device and lock each have a vertical sliding connection to the pipe. There is a threaded rod to raise and lower the pipe relative to the raft.

The appts. is used to aerate a lake by pumping water from the bottom and discharging it near the top. The pipe is pivotable for ease of installation of the raft on the lake. 21.6.77 as 808457 (6pp295)

Electro-catalytic treatment of waste water - with controlled addition of electrolyte and filtration of treated water
OMNIPURE INC 28.02.78-US-882264
J03 (18.12.79) C02b-01/82

A measured quantity of an electrolyte is added to an influent stream before passage between closely spaced, electrocatalytically active electrode plates which have exposed surfaces including a precious metal or metaloxide. The plates are positioned parallel to the flow of waste water. A constant level of waste water is maintained in the vessel holding the plates. Application of an electric current generates disinfecting chemicals and causes suspended solids to float as a foam which is continuously removed.

The treated waste water stream is passed through a filter to remove fibrous residual suspended solids. The conductivity of the influent stream is measured and this value is used to control the amt. of electrolyte added, thereby controlling the amt. of residual chlorine present in the treated stream.

The process is used to treat sewage. The appts. reduces the problems of sludge disposal and reduces odour problems. 28.2.78 as 882264 (7pp295)

Biological effluent treatment plant - with three tanks arranged for reversible flow
UNION CARBIDE CORP (KAEL/) 18.11.74-CH-015346
(18.12.79) *CH-572-003 C02c-05/10

In an activated sludge water treatment process in which waste water is passed through a series of three tanks in the first two of which aeration occurs and in the third the sludge settles and pure water is removed and during which treatment the sludge content of the first two tanks

decreases as the content in the third tank increases, the water flow direction is reversed when the sludge content in the first tank decreases to a specified level.

Reversal is accomplished by ceasing water intake to the first tank starting intake to the third tank while ceasing to remove water from any of the tanks, and after the sludge has settled in the first tank establishing reversed flow from the third-second-first tanks.

Mechanical sludge removal is unnecessary. 2.8.78 as 930136 (+10.6.75, 29.11.76-US-585572, 745567)(7pp1376)

Aeration of waste in septic tank - by controlled circulation through external ducting with addition of air
SMITH A J 23.10.78-US-953475 (11.08.77-US-823622)
(18.12.79) C02c-01/08

Sewage is aerated in a septic tank having curved walls to help in creating a revolving flow of the waste. Ducting removes waste from one side of the tank and it is pumped to a point where oxidising fluid is introduced. Ducting conveys the waste and oxidising fluid to a distribution outlet positioned within the tank but near the opposite side to the ducting inlet.

The outlet includes an elongated slit in the ducting which is bent so that it extends along the length of the tank. The ducting is made of expandible material and the slit opens in response to application of pressure to the fluid flowing in the ducting.

The system is used to aerate and diffuse solid material in low cost as well as other sewage disposal systems. 23.10.78 as 953475 (5pp295)

Enzyme reaction rate measurement - with thermistor reading for adjusting temp. correction coefficient

OLYMPUS OPTICAL KK 10.05.77-JA-053596

A89 R16 (20.12.79) *DT2820-441 G01n-31/14 G01n-33/16

The velocity of an enzyme reaction, e.g. in blood, is measured. The extinction (optical density) is measured per time unit taking into consideration the measuring temp. A temp. probe is put directly into the reaction soln. so that alterations in the temp. correction coefft. can be made throughout the measurements.

A suitable appts. comprises a transparent measuring cell in a thermostat block, a source of light and a means for measuring the extinction. A temp. probe in the measu

ing cellis connected to a conversion control to calculate the alterations in the temp. correction coefft. 10.5.78 as 820441 (6pp068)

BOEF ★ D16 00076C/01 ★DT 2825-636
Microbiological test materials e.g. for detecting microorganisms - comprise nutrient substrate covered by selectively permeable polymer film

BOEHRINGER MANNHEIM GMBH 12.06.78-DT-825636
A96 B04 J04 (20.12.79) C12k-01/10
Microbiological test materials comprise a nutrient-impregnated absorbent substrate covered by a film which is permeable to nutrients but impermeable to bacteria. The film is a water-insoluble polymer film produced from an aq. polymer dispersion and modified with one or more pore formers (i.e. cpds. which dissolve or swell on contact with H_2O).

The test materials can be used as a substitute for conventional agar culture media, e.g. for detecting microorganisms in body fluids, foodstuffs or water. They give the same results as agar media but have better storage characteristics and are easier to dispose of by incineration. 12.6.78 as 825636(34pp367)

MUZZ/ ★ D16 00225C/01 ★DT 2923-802
Chitosan-glucan complex from fungal mycelium - by treating with alkali to remove chitin acetyl groups (NL 18.12.79)

MUZZARELLI R 14.06.78-IT-000625

Maltase prepn. which can hydrolyse maltotetraose slowly - useful in amylase assays

UNIV OF ALABAMA 16.11.76-US-742240 (07.10.76-US-730820)
B04 + R16 (03.01.80) *US4071-407 C07h-03/06 + C08b-01/10

An oligosaccharide fraction having no G4 or lower oligosaccharide content is obtd. by adding a yeast and a maltase simultaneously to a source soln. contg. $\geq G4$ and higher oligosaccharides, and then sepg. the yeast and maltase from the soln.

Pref. the source soln. is first treated with the yeast or maltase alone. The yeast used is the baker's or brewer's yeast. *Saccharomyces cerevisiae*, *S. italicus* or *S. uvarum* and the maltase is the Peak II enzyme derived from *Saccharomyces* strain ATCC 20487, which hydrolyses maltotetraose but not higher malto-oligosaccharides.

The process is esp. used to extract a suitable mol. wt. range of oligosaccharides for use as a substrate for amylase assay, without large amts. of glucose, maltose (G_2) and maltotrose (G_3). 4.10.77 as 041257 (7pp931)

BIFO- ★ D16 00375C/01 ★GB 2023-286
Continuous flow analysis device - uses a carrier in which sample is injected and measuring cell provided reaction characteristic

BIFOK AB 14.06.78-SW-006853
J04 R16 (28.12.79) G01n-21/26

The continuous flow analysis device quantitatively determines slowly reacting cpds. using a single measuring cell. The sample is injected at a point into a continuously flowing sample zone in the form of a reproducible gradient. The zone is led into a cell and the flow is stopped by shunting the carrier flow by stopping a pump. The carrier flows via a coil and the sample and carrier flows via another coil to the cell. The coils and the cell are within a thermostat.

When the flow is stopped the reaction occurs in the cell, while the reaction mixt. is measured. The reaction speed can be detected from the incline of the obtd. response curve and the amt. of sought-after cpd. is calculated. By setting the stop at a certain point in the curve and always selecting the point at the same time distance from the peak of the curve during flow a total reproduction of the analysis is ensured.

Useful in the reaction between glucose dehydrogenase and β -D glucose in the kinetic determ. of glucose for investigation and verification of the stop-flow injection principle. 13.6.79 as 0120567 (6pp1371)

Enzyme substrate compositions with high activity - e.g. of glycerol tricaprionate adsorbed onto inert carrier useful for making food storage indicators

KOCKUMS CHEM AB (FOOD-) 25.04.73-US-354412

E17 R16 (D13) (09.04.79) *NL7405-543 C07g-07/02

Compsns. comprises (a) a solid inert carrier with a surface of $\geq 50 \text{ m}^2/\text{g}$, pref. $\geq 200 \text{ m}^2/\text{g}$ and (b) a layer contg. a substrate for the enzyme (esp. glycerol tricaprionate) bound to the carrier by adsorption and which is difficultly soluble in water and stable in the absence of the corresponding enzyme. The layer may also contain diluents such as mineral oils, higher aliphatic alcohols, polyols etc. and viscosity modifiers such as metal soaps (e.g. Al stearate). Products are useful in combination with suitable enzymes and pH indicators to indicate the storage condition (acid prodn.) of foods such as refrigerated and deep frozen foods.

Cultivating yeasts in nutrient medium - contg. mother liquor from cotton-seed filter cake, ammonium phosphate and water, used in food industry

GIDROLISFROM DES 21.07.77-SU-508935

(15.04.79) C12b-03/12 C12c-11/08

Yeasts are cultivated in nutrient media contg. sources of carbon, nitrogen, phosphorus, mineral substances and water.

Inexpensive nutrient medium can be prep'd. using as a source of carbon and mineral substances a mother liquor obtd. from the filter cake of cotton seeds, after sepn. of the oil, proteins and phytin. Ammonium phosphate is used as a source of nitrogen and phosphorus. The compsn. contains (in g/l) mother liquor of cotton seeds 24-30 (calculated as dry substance) ammonium phosphate 3-6; the balance is water.

Activating pressed yeasts for use in bakery or confectionery - by soaking in nutrient medium contg. acid wort concentrate and mono:potassium or di:potassium phosphate salt

VORO TECHNOL INST 06.06.77-SU-494486

(D11 D13) (16.04.79) C12c-11/26

Pressed yeasts are activated, for use in bakery or confectionery, by soaking in a nutrient soln.

This process is intensified by using as a nutrient medium a mixt. of a concentrate of acid wort and mono- or dipotassium phosphate, and keeping the yeasts in this mixt. for 45-60 min. at 32-34°C under aerobic conditions. By this method, the yeast activation time is shortened by 20-30%. The nutrient medium is inexpensive.

Maturing sherry by actinic irradiation and contact with oak wood - intensified by introduction of wine yeast autolysate and additional storage under oxygen-free conditions

YALOVENY AGR IND AS 06.09.76-SU-401036

(16.04.79) C12h-01/22

Sherry can be matured by the action of actinic radiation; subsequently, the sherry is cooled and stored in contact with some oak wood.

The process is intensified and the quality of the product is improved by introducing into the sherry, after the cool-

ing, 0.5-1.0 vol.% of an autolysate of wine yeasts, heating the sherry at 40-45°C for 10-20 days, and then cooling to 15-25°C. After the storage in contact with oak wood (e.g. 12 months at 18°C), additional storage (e.g. 6 months) is applied under oxygen-free conditions under an inert gas (e.g. N_2). The ratio of the two storage periods is 2:1 to 3:1 respectively.

The method is suitable for the maturing of dry sherry. Khachatryan, R.P., Kozub, G.I., Averbukh, B.Ya. et al. Bul. 14/15.4.79. 6.9.76 as 401036 (2pp70)

AUCO = * D16 01316C/01 ★SU -657-062
Pseudomonas strain for decomposing alkyl sulphate s) in effluents - is used for effluents from textile factories contg. high concn. of sodium dodecyl sulphate

AS UKR COLL CHEM 09.11.77-SU-546016

F06 (D15) (16.04.79) C12k-01/02

Strain *Pseudomonas* sp. 1C can be used for purification of aq. effluents, esp. of detergent effluents contg. alkyl sulphates from textile factories.

This strain is capable of decomposing sodium dodecyl sulphate in higher concentrations (up to 7 g/l) than *Citrobacter freundii* 2T used for this purpose heretofore (up to 3 g/l). The strain *Pseudomonas* sp. 1C was found in the effluent-purifying plant in Kiev.

Pseudomonas sp. 1C appears in the form of straight or slightly bent rods, single or forming short chains. The strain is gram-negative. It does not form spores or capsules. The oxidase test is positive; the strain produces lecithinase and gelatinase. The strain produces levan from saccharose; assimilates mineral forms of nitrogen; assimilates glucose, arabinose, xylose. The strain is aerobic. Optimal cultivation temp. is 28-30°C. Suitable cultivation media include meat-peptone agar or broth. In mineral medium technical alkyl sulphates are decomposed in concn. up to 1 g/l.

Grape or berry pulp juice extractor - has eccentric sleeve connecting
ribbed bush of perforated drum with auger shaft

ODESS FOOD IND TECH 22.06.77-SU-498488
P71 (25.04.79) B30b-09/16 C12g-01/02

The yield of juice is increased and the quality of juice is
improved by an eccentric sleeve connecting the ribbed bush
of the perforated drum with the auger shaft.

The pulp from the hopper is subject to increased press-
ure during the interaction of the auger and the perforated
cylinder. The position of the eccentric sleeve places its
projection in antiphase with respect to the end of the
pressing flight of the auger blade.

As a result, the pulp at the tip of the pressing blade is
not squeezed between the outer and inner perforated cylind-
ers, and it enters the press chamber without restraint.
The inner perforated cylinder on the rotating eccentric
sleeve carries out a planetary motion and gradually com-
pacts the pulp.

Culturing fungi for microscopic examination - maintaining sterility
of culture medium and cover slip until ready for use
LUKACSEK P A 27.10.77-US-845897 (22.04.77-US-789773)
(18.12.79) C12b-01

Fungi are cultured preparatory to microscopic examin-
ation by removing a cover from a base formed of optically
clear material and then removing a sealing membrane to
expose a culture nutrient medium. This is in jelled form
and is contained within a compartment in the base. The
jelled material fills the compartment to a level flush with
the planar top surface of the base.

A fungi is inoculated into the culture medium and a cov-
er slip is placed to rest on the planar top surface to seal
the compartment and to be in contact with the culture
medium. The fungi are incubated for development of
fungal growth on the culture medium and on the downward-
ly facing surface of the cover slip.

The method is used to prepare a fungi for microscopic
examination. The possibility of contamination of the cul-
tured fungi is considerably reduced. 27.10.77 as 845897

GORD/ ★ D16 01598C/01 ★ US 4179-338
Microbiological medium sterilisable by ionising radiation - contg.
buffer soln., nutrients, and electron acceptor

GORDON M R 27.04.78-US-900791 (19.09.77-US-834169)

(18.12.79) C12k-01

Microbiological medium consists of a buffer soln. contg.
nutrients for microorganisms, and an electron acceptor
(I). (I) consists of (a) α- or β-nicotinamide adenine di-
nucleotide reduced form, di-Na (NADH); and (b) one cpd.
from β-nicotinamide mononucleotide (or reduced form, di-
Na), α- or β-nicotinamide adenine dinucleotide (NAD),
pyridoxine HCl, pyridoxal-5-phosphate HCl, nicotinamide,
adenine dinucleotide phosphate (NADP), cytochrome C, or
nicotinamide 1,N⁶-etheno adenine dinucleotide phosphate.

Use of (I) in the medium reduces the adverse changes
that are known to occur in media exposed to radiation, and
increases the degree of ionisation caused by the radiation
so that more microorganisms are killed. In addn., the
medium has less H₂O loss due to dessication during stor-
age and less surface syneresis and is hence stable to stor-
age at room temp. for ≤ 2 years. 27.4.78 as 900791

Microporous element with tapered penetrations in each layer - induces flow of fluid through element without additional driving energy and without osmosis effect

DEUTSCH D H 14.05.79-US-038586 (30.05.78-US-910110)

J01 + Q56 (27.12.79) *NL7904-243 B01d-31 + F04b-39

D/S: N(BR, CH, DT, GB, JA, SU, SW).

Microporous element comprises ≥ 3 bonded layers, each layer contg. tapered, hollow penetrations. The larger ends of the hollow penetrations all terminate in one face whilst the narrower ends terminate in the opposite face, adjoining layers being so oriented that all the penetrations taper in the same direction. A fluid passing through the element passes through $\leq 10 \times 10^6$ hollows in sequence.

Depending on the application, the total thickness of the composite element lies between 0.001 microns and 100 cms, whilst the average distance between adjacent pores across the surface of a layer is between 0.001 and 100 microns. The construction of the element is such that a gas or liq. in which the element is placed is caused to flow through the element without the use of any additional energy and without the necessity of a difference in concn. across the element creating an osmosis effect.

The element induces the flow of the fluid for which it is constructed without the use of additional energy. It is partic. useful for cleaning the gaseous discharge from a chimney, inducing an atmosphere change in a biological reaction vessel without permitting the passage of liquid, or inducing the flow of a liq. in a reaction system.

The α-galactosidase used is obtd. by culturing Streptomyces olivaceus var. raffinose utilizer, Mortierella vinacea var. raffinose utilizer, etc. Pref reaction conditions are 45-55°C, Brix. concn. of 20-60 pH of 5.0-5.2, enzyme concn of 2500000-5500000 units per g raffinose, and reaction time of 2-3 hrs. The ion-exchange resin used is a combination of cation-exchange resin H type and anion-exchange resin OH type. The method minimises accumulation of raffinose and increases yield of sugar. 25.12.70 as 128413, C13d-3/00 (4.12.79) HOKKAIDO TOGYO KK; AGENCY OF IND.SCI. TECH. (8pp83)

Typically the enzyme system is confined to that obtd. from a higher plant and/or bacterial source. Suitable sources are swedes, carrots, stalks, leaves, seeds, grain etc., or bacteria from Pseudomonas, Flavobacterium, Escherichia, Klebsiella, Erwinia, Sarcina, Streptomyces etc. 16.7.75 as 008476 (12pp913)	
Plant cellulose hydrolysis using dil. inorganic acid - comprises comminuting raw material and mixing with acid to pumpable mixt. KASMANNHUBER H 26.01.68-DT-642534 E13 (20.12.79) C13k-01/02 In a process for the stepwise partial or total hydrolysis of cellulose plant raw materials with dil. inorganic acids, in which one or more short-term hydrolysis reactions are released at 100-240°C and the inorganic acid is changed after each hydrolysis, the raw material and the dil. acid are conveyed concurrently through the reaction zone and hydrolysis takes several min. at most. Novelty consists in comminuting the raw material down to dust grain size; mixing with dil. acid to a pumpable mixt. which cannot be unmixed by sedimentation and continuously passing this mixt. through the hydrolysis reaction zone. Yield is increased. Direct conversion takes place to mono-saccharides. Hydrolysis reaction time, by-prod. formation and hydrolysis step no. are reduced. Hydrolysis plant can be simplified. 26.1.68 as 642534 (6pp200)

Persian lamb skin primary cleaning brush - has metal teeth with spherical heads and held in comb on shaft by elastic pads

KAZA AGRIC ELEC MEC 04.03.77-SU-460670

(20.04.79) C14b-15

The primary cleaning of Persian lam skins is improved process efficiency is enhanced by the implement having metal teeth with spherical heads on the free end of the comb. The latter is attached to the shaft by an elastic pad.

The fur side of the skin is fed towards the rotating bush, and the comb teeth impact the fur and at the same time comb the hair and loosen the dry dirt adhered to it. The elastic pad softens the blows and thus prevents hair detachment from the skin.

A32 P32 (A14 A96) (21.11.79) A61c-13 B29c-05 C08j-05

Resin mouldings are produced by forming a mould contg. water on the surface of at least the moulding space side, pouring the moulding materials contg. cyanoacrylates into the moulding space, and polymerising and curing the cyanoacrylates with the water contained from the surface side of the mould.

The moulding materials are cured at ordinary temp. under ordinary pressure. As the water contained in the mould acts as the reaction catalyst, the moulding operation is easy, and mouldings of precise mould-shape are obtd.

The cyanoacrylate polymers have excellent strength, heat resistance, chemical resistance and weatherproof property. Therefore, the mouldings obtd. are free from scratch at the time of after-treatment (e.g. grinding). Cyanoacrylates include, pref. alkyl- α -cyanoacrylates. The moulds comprise e.g. water-contg. agar-agar, sodium alginate, PVA and gelatin. The moulding resin liqs. comprise cyanoacrylates and polymethacrylates in a wt. ratio of 30:70-70:30. 15.5.78 as 057306(5pp136)

 Artificial tooth root of plastic loaded with a bioactive phosphate - to form a root bone graft without later rejection
 REISS G (RIES/) 23.07.77-DT-733394
 A96 P32 (18.12.79) *BE-864-402 A61c-13
 Artificial tooth includes implantable root constituted of a biostable polymer matrix compatible with human tissue, reabsorbable, bioreactive Ca phosphate in finely dispersed form being introduced in the polymer matrix. A porous layer of non-reabsorbable Ca phosphate encompasses the bioreactive Ca phosphate; a core forming connecting means for mounting dental superstructure being inserted in the polymer matrix.
 An intermediate member is arranged in the tooth neck encompassed by the gingiva and extending between the tooth root and the dental superstructure. The intermediate member comprises a tissue compatible material supporting the sealing contact of the gingiva. The dental superstructure is shock-absorbingly connected to tooth root.
 The tooth can permanently grow together with jawbone. It withstands high mechanical loads. 6.1.78 as 867336 (pp964)

Air ducting outlet filter box partic. for hospitals etc. - pressed and folded from single piece of sheet metal
DELBAG-LUFTFILTER G 17.03.78-DT-U08587
J01 P34 Q74 (16.11.79) A611-09 B01d-35/14 B01d-46/42 F24f-03/16

Box is of the type which is fitted with a removable, mechanical filter element. It is also capable of accommodating selected equipment for conditioning the air and for controlling the conditioning processes, e.g. ultra violet sterilising tube, heating/cooling coils, humidifying sprays timer(s) etc.

Improved is that the box comprises a sheet-metal, main casing pressed and folded from a single piece of material. The casing is formed with stiffening ribs or channels and cruciform embossed face(s) to prevent bucking. The outlet aperture of the casing is surrounded by a stiffening rib to which is internally welded a frame to provide a seating on which the filter element can be clamped.

Brackets, lugs, studs, nuts etc. are fixed appropriately inside the casing to secure conditioning equipment controls etc. Easy removal of the filter element for changing, cleaning etc. Should give full access to all encased equipment and controls. These to should be easily removable and replaceable.

Used to provide safe, aseptic, conditioned sterile wards etc. Appts. is simple and inexpensive to install in existing hospitals etc. The construction is easy to clean, check and maintain. 16.3.79 as 007216 (30pp448)

One way absorbent laminate - comprising nonwoven fibrous backing and ruptured film cover
JOHNSON & JOHNSON 21.06.78-US-917696
A94 F07 P73 (A96) (03.01.80) B32b-03/28 B32b-05/14
Laminate which will absorb liq. in one direction but oppose its flow in the other, comprises a non-woven fibrous backing layer and a fractured plastics film layer bonded to one surface of the backing layer. A prefd. film is of polyethylene and the backing layer can be of any conventional hydrophilic fibres, e.g. papermaking fibres.

Laminate can be made by bonding the film to the layer between heated pressure rolls. The roll contacting the film has a dimpled resilient surface and is driven at a slightly higher speed than the other roll. The compression and shearing effect thus accomplished fractures the film into a reticulated configuration.

Used for one-way absorbing. The laminate is useful in sanitary application and as surgical dressings. 19.6.79 as 021283 (9pp525)

MOLI- ★ D22 00460C/01 ★GB 2023-671
Knitting elastic dressing bands with chain warps - omitting some needles to provide retraction space for elastic wefts
MOLINIER SA 27.06.78-FR-020089
F04 (03.01.80) D04b-21/18

A knitted fabric band is formed on a Raschel machine with longitudinal chain warps and an elastic weft. Some needles between the warp knitting needles are omitted.

The spaces formed between the chain warps provide a retraction space for the wefts. The selvages are uniform and not rolled up. The output of the machine is increased. The fabric is used as an elastic dressing. 5.6.79 as 019559 (5pp1320)

SEIS ★ D22 00590C/01 ★J5 4146-84
Porous material prepn. from citrus fruit pith - by dissolving in alkaline soln. sepg. out alkali metal salt of pectic acid, gelling an aq. soln. of the salt and drying the gel
SEISAN KAIHATSU KAGAKU 09.05.78-JA-055111
F08 J01 (D15) (16.11.79) B01d-13/04 C08j-09/28

Process comprises treating the pith of citrus fruits with an aq. soln. with pH 1-3 making the pH value of the aq. soln. 10.5-12.5 using alkali to dissolve the pith, then adding on alcohol to the liq. to separate the pptd. alkali metal salt of pectic acid, gelling an aq. soln. of the sepd. alkali metal salt of pectic acid with a water sol. polyvalent metal salt and thermally drying the prod.

As alkali NaOH, KOH or weak acid salt of Na or K is suitable. As alcohol, easily recoverable methanol, ethanol and isopropanol are suitable; water-insol. alcohol cannot be used.

A porous substance with controlled pore size and strength is mfd. easily with high reproducibility from a natural material. It can be used for finely porous films for ultrafiltration, gas-permeable food packaging films, bacteria-proof artificial skin, artificial leather, etc. 9.5.78 as 055111 (8pp57)

IDEK ★ D22 00664C/01 ★J5 4147-17
Sublimable compsn. contg. camphane - with perfume, mothproofing agent, antifungal agent or antioxidant as active material

In the prepn. of carbazates of formula (I)

(I)

(where R is H, 1-6C alkyl,
1-6C hydroxyalkyl, 2-7C alk-
anoyl, benzoyl or -CONR₁R₂;
and R₁ and R₂ are 1-6C alkyl,
1-6C hydroxyalkyl or 1-6C
aminoalkyl), a cpd. of formula

(II)(where X is Cl or Br) is reacted with 1 or 2 equivalents
of an alkali carbonate and 1 or 2 equivalents of a hydrazine
of the formula R''NHNHCOOCH₃ (III) (where R'' is CF₃SO₂,
CF₃CH₂SO₂, CH₃SO₂ or CH₃C₆H₄SO₂) in an inert solvent at
75-85°C, and (I) is subsequently isolated.

(II)

Cpds. (I) in which R is not H, 1-6C alkyl
or -CONHCH₃ are claimed as new cpds.
Intermediates of formula (III) are also
claimed as novel cpds.

(I) have antibacterial activity against
Gram-positive and -negative organisms and can be used as
industrial antimicrobial agents (e. g. for water treatment,
for sludge control, or as paint or wood preservatives) and
as disinfectants for topical use. They may also be used
for the treatment of infections in animals.

Specific cpds. (I) include methyl 3-(2-quinoxalinylmeth-
ylene)-carbazate 1,4-dioxide. In an example, this is pre-
pd. in ca. 100% yield by reacting 2-bromomethylquinoxal-
ine 1,4-dioxide in acetonitrile with N-methoxycarbonyl-N'-
trifluoromethylsulphonyl-hydrazine in the presence of an-
hydrous K₂CO₃.

(3)-Hydroxy-(4H)-pyranone-(4) flavouring agents prepn. - by oxidising (3,4)-di:hydro-(2H)-pyranone-(3) cpds. prepd. from furfural

OTSUKA KAGAKU YAKUHI 16.07.76-JA-085394
E13 (04.12.79) *J53012-865 C07d-309/40

3-Hydroxy-4H-pyran-4-ones (II) are prepd. by oxidising 3,4-dihydro-2H-pyran-3-ones of formula (I).

(where R is H or 1-6C straight or branched alkyl). Starting cpd. (I) is novel and can be prepd. in several steps from

furfural. Oxidn. is carried out at 50-150°C, pref. 70-100°C, for 5-24 hr. according to known oxidising methods such as selenium dioxide method, nitrite/acid method or air oxidn. Aliphatic alcohols, cellosolves or cyclic ethers such as THF or dioxan may be used as solvents. Products (II), useful as flavouring agents, are prepd. economically at lower cost with little pollution.

In an example 3,4-dihydro-2H-pyran-3-one (2.94g) and selenium oxide (3.4g) were dissolved in ethanol (20 ml) and water (10 ml) and the soln. was refluxed for 8 hr. Produce selenium was filtered off, and the filtrate was worked up to give pyromeconic acid (2.2g) as colourless crystals. Yield 65.4%. 16.7.76 as 085394, C07d-309/40 (4.12.79) OTSUKA KAGAKU YAKUHI (5pp) (J5 3012865)

Perfumery compsns - contg 3-isopropyl - or 3-isopropenyl cyclopentene derivs

GIVAUDAN L & CIESA 17.03.72-CH-004040

E15 (04.12.79) *DT2313-017 A61k-07/46 C07c-47/38 C07c-61/38 C07c-69/74

Cyclopentenones having the general formula (I) (where R_1 is H, OH, lower alkyl or lower alkoxy, R_2 is H, lower alkyl or lower alkylidene and the dotted line denotes an opt. bond) are useful as perfumes and ingredients of perfume compsns. They are prepd. by reacting a cpd. having the formula (II) in the presence of an acid catalyst with an enol ether (III') or a ketal (III'').

(in which R_5 is H, lower alkyl or lower alkenyl) and opt. catalytically hydrogenating a 3-isopropenyl cpd. (I) obtd. to the 3-isopropyl cpd. of formula (I) and/or oxidising an aldehyde obtd. of formula (Ia) to the acid (Ib), and opt. converting these to the ester (Ic), (where R_3 is lower alkyl). 15.3.73 as 011379/78 Div. ex. 30475/73 (clg. 17.3.72-CH-004042) A61k-7/46, C07c-47/38, 61/38, 69/74 (4.12.79)

Norbornyl derivs of formula (I), (II) or (III) (where R_1 is ethylidene or ethyl; and R_2 is 1-5C alkanoyloxy or OH) are prepd. by reacting 5-ethylidene-2-norbornene with a 1-5C alkane carboxylic acid in the presence of a proton

active catalyst. The esters produced are hydrogenated and/or saponified in arbitrary order. Specific (I) has R_1 ethylidene and R_2 propionyloxy. The cpds. are new and used in perfume compns.

Typically prepn. is effected using as catalyst formic sulphuric, phosphoric, toluene sulphonic acids, BF_3 (etherate or hydrate) or acid resin, as 0.1-50 (1-5) wt. % r.r.t. organic acid. Ethylidene norbornene to acid molar ratio is 1:1-5, with reaction temp. of e.g. 50-100°C. Saponification is effected in refluxing alkali hydroxide (aq. or alcoholic), and hydrogenation in a solvent with a Raney nickel or Pd/active carbon catalyst. 6.10.70 as 014660 (13pp913)

Electrostatic separator - for removing suspended particles from liquids has charged and earthed electrodes separated by insulating sleeving

DES CONS TECHN INST (KDFO) 02.08.73-SU-957556

J01 P41 (28.04.79) B01d-35/06 B03d-05/02

Electrostatic separator, for cleaning liquids, e.g. benzene solutions of micelles of vegetable, cottonseed, and other oils, from solid particles, can be used in the chemical, food and petrochemical inds. It consists of a body with a lid, potential-generating electrodes between which earthed electrodes are placed, these being fastened to a horizontal drive shaft and separated by metallic sleeves, pipes to admit the impure, and withdraw the purified liquids, and means to remove the residues from the electrodes.

Productivity is increased, by adding to the outside of each metal sleeve spacing dielectric sleeves, on to which the potential electrodes are fastened. Dielectric combs are rigidly fastened to the internal surface of the body, into slots in which the ends of the potential and earthed electrodes are fixed. The lid is provided with a seal which is pressed to the last electrode. The inlet pipe has widening-out chambers containing deflecting plates, and have slits, the length of which equals the width of the body.

hydrogenated fatty acid prodn. from crude glyceride oil - by catalytic hydrogenation then fat splitting

SCM CORP 24.07.78-US-927452

B05 E17 (18.12.79) C11c-01/04 C11c-03/12

Prodn. of hydrogenated fatty acids (I) comprises catalytic hydrogenation of crude glyceride oils (II) until significant increase in saturation has occurred (esp. to iodine value (iv) 0-100). Themixt. is then split in a separate zone to give (I) and glycerine by-prod. which are recovered.

(I) may then be refined e.g. by bleaching, fractional crystallisation and/or distillation. The catalyst is esp. 0.025-0.3% Ni plus 0.2-3% Cu chromite (by wt. of oil) or hydrogenation is in two stages. First to reduce iv to $\geq 10\%$ less than the initial value, then in presence of 0.01-0.3 wt. % Ni only.

(I), opt. after (inter)esterification, polymerisation, etc., are used to makeprods. useful in pharmaceutical, cosmetic, textile and rubber industries. Difficult alkali degumming or refining, and hydrogenation of fatty acids are avoided. 24.7.78 as 927452 (4pp1251)

Washing agent mixt. for textiles comprises (a) 5-80 wt. % of a liq. non-inorganic surfactant with a melting/casting pt. of > 25°C, (b) 95-20 wt. % fat acid of melting/casting pt. of > 25°C, which is > 40% neutralised and has 8-22C, and (c) 0-20 wt. % water, with proviso that the mixt. has a pH 4-8. Pref. the acid has a degree of neutralisation of 5-35%.

The washing agent, used in laundries, is a stable liq. which can be easily poured into cold water to form a stable stock soln. which does not gel or solidify so that the 'soap' transport tube do not require blowing-out at the end of each days operation. 12.3.74 as 003258 (4pp913)

 Hand etc. cleaner for petroleum or paint industry - contg. water and mixt. of organic solvents, with addition of ethoxylated mono- and di:alkyl-phenol derivs. and potassium soap
 DOMESTIC SERV CHEM 07.10.77-SU-539123
 E19 (20.04.79) C11d-03/44

Compsn. for removing from hands any petroleum or paint contamination contg. water, a surfactant and an organic solvent is improved by using a solvent mixt. comprising cyclohexanol, ethylcellosolve and benzyl alcohol, and as a surfactant ethoxylated mono- and di-alkylphenols; liquid 40% potassium soap is added. By this method, the deter- sive properties of the compsn. are improved whilst its

toxicity is diminished.

The compsn. contains (in wt. %) liquid 40% potassium soap 40.45, ethoxylated mono- and di-alkyl-henols 8-10, cyclohexanol 4-5, ethylcellosolve 15-20, benzyl alcohol 8-10; the balance is water.

Machine washing of solid articles - using washing agent contg. little or no phosphate and cation exchanger

HENKEL KG AUF AKTIEN 25.11.76-DT-653479

E36 + P42 P43 (18.12.79) *BE-860-343 B08b-03 C02b-01

Solid soiled materials are machine washed by withdrawing and recycling the wash liquor in contact with the materials through a silicate cation exchange cpd. of formula $(M_2/nO)_x \cdot Me_2O_3 (SiO_2)_y$ of particle size $\geq 10 \mu$ and contg. combined water.

In the formula, M is a cation of valence n exchangeable with calcium, Me is Al or B, x is 0.7-1.5 and y is 0.8-6. The silicate cpd. has a calcium binding power of ≥ 50 mg of CaO per gm. The silicate cpd. is maintained out of contact with the soiled materials for such a time that the recycling liq. passes through the silicate cpd. $\geq$ twice, in the presence of other soluble washing and cleaning cpd. while reversing the direction of flow of the liq. through the silicate repeatedly.

The smaller particle sized aluminosilicates prep'd. enhance the washing effect without clogging the filter pores. 16.11.77 as 852028 (10pp931)

PROC D25 40886B/22 #US 4179-382
Textile softening compsn. - contains cationic textile softener, esp. quat. ammonium or imidazolinium salt, and specified polymeric cationic salt

PROCTER & GAMBLE CO 21.11.77-GB-048377 (27.10.78-US-955559)

A87 E19 F06 (18.12.79) *DT2849-931 D06m-13/26

Textile conditioning compsn. comprises (a) a cationic textile softening agent having either 1 alkyl or alkenyl gp. with $\geq 16C$ or 2 alkyl or alkenyl gps. having 10-22C; (b) 0.001-0.70 wt. % of ≥ 1 polymeric cationic salt (I); and opt. (c) a water-insoluble nonionic textile conditioning agent, in an amt. such that the wt. ratio of component (c), if present, to (a) plus (b) is $\geq 1:10$.

(I) is selected from (i) cationic polysaccharide gums, (ii) cationic starch (derivs.), (iii) polyvinyl pyridine and polyvinyl pyridinium salts and their copolymers, (iv) cationic PVA, (v) cationic polyvinyl pyrrolidone copolymers, (vi) copolymers of dialkylaminoalkyl methacrylate, in which each alkyl has 1-3C, with styrene, or a neutral acrylic ester, (vii) quaternised polyethyleneimines having > 10 ethyleneimine residues in the mol. and (viii) certain specified condensation copolymers, e.g. those having the repeating $[-O-CH_2-CH(-OA)-CH_2-O-C(=O)-R-C(=O)-]$ where R is a 1-6C alkane, hydroxyalkane or alkene residue or an aryl gp. and at least some of the radicals A are quat. N-contg. gps., the remainder being H atoms.

Compsn. is used in the final rinse after a washing operation. It has good softening properties and improved resistance to carry-over of anionic surfactants into the final rinse. 27.10.78 as 955559 (9pp927)

PROC D25 26945A/15 = US 4179-390
Laundering additive contg. an organic peroxide precursor - impregnated on a solid support and released in water

PROCTER & GAMBLE CO 13.05.77-GB-020213 (06.10.76-GB-041491)

A97 E19 (E34) (18.12.79) *BE-859-461 C11d-03/39 C11d-07/54

A laundry additive prod. is prep'd. for use as a bleaching aid by forming a fluid mass contg. an organic peroxy bleach precursor; contacting a flexible solid substrate with the fluid mass; and causing the mass to solidify on the substrate to yield a precursor:flexible solid substrate in wt. ratio of 30:1-1:10.

The peroxy bleach precursor is capable of reacting in aq. washing liquor with an inorganic peroxy bleach to form the organic peroxy bleach of bleaching performance equiv. to the inorganic peroxy bleach. The inorganic bleach is an alkali metal percarbonate, persilicate or perpyrophosphate.

The laundry additive prod. contains the peroxy bleach precursor attached to the flexible substrate and releasable in aq. washing liquor by soln., dispersion, bleaching, softening or melting to react with the inorganic bleach to form the organic bleach. 4.10.77 as 839490 (16pp931)

HENK D25 76322A/43 = US 4179-392
Phosphate free washing powder compsn. contg. aluminosilicate - i admixture with surfactant, alkane poly:phosphonic acid (deriv. complexant and mineral peroxy cpd.

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of, Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry	F	Textiles, Paper, Cellulose
A+	Polymer Applns.	G	Printing, Coating, Photographic Chemistry

WEE- ★ D11 02040C/02 ★EP ---6-290
Vacuum cooling moisture-contg. foodstuff - with control based on dimensional changes of the article under vacuum
TWEEDY BURNLEY LTD 12.05.78-GB-019104
(09.01.80) A21d-15/02 A231-03/02
D/S: E(DT, GB, OE, SW).

A moisture-contg. foodstuff is cooled by placing it in a chamber and evacuating the chamber. The evacuation is controlled in response to dimensional change of the foodstuff during the cooling operation.

The control is effected by a transducer which is operated by a dimensional change detector. An actuator controlled by the transducer regulates the pressure within the chamber in response to transducer output signals.

Vacuum cooling rates are controlled, particularly for certain breads, esp. rye breads. Control of the vacuum cooling operation avoids destructive expansion of the bread.

11.5.79 as 300810 (23pp1044).

Protein enriched bread prodn. - includes addn. of protein concentrate to dough before shaping etc.
BREAD-BAKING RES 30.09.74-SU-064105
(30.06.79) A21d-02 A21d-08

Bread prodn. includes prepg. nutrient mix for the leaven (flour and water); stirring and fermenting the leaven; mixing together the flour, the leaven, a protein-contg. component and water to form the dough; leaving the dough aside; forming the dough and baking.

The process is accelerated and the quality of bread is improved by adding a protein-contg. substance to the nutrient mix for the leaven, and introducing into the fer-

mented leaven a yeast suspension (contg. pref. 2-4% of yeasts).

Tubular pasta e.g. macaroni drying - using live steam and followed by hot air at specified flow rate and temp.
MOSC FOOD IND TECH 23.12.77-SU-548631
Q76 (25.04.79) A231-01/16 F26b-03/06

To increase the product quality and reduce the drying time, prior to drying with hot air the pasta is dried with live steam at 120-140°C and 1.6-2.5 m/sec. until the product humidity is 23-18%. The pasta is retained in the satd. steam media for 5-15 min.

After 5-15 min. hot air with following parameters is supplied to the chamber: temp. 60-80°C, relative humidity 60-80% and velocity of 0.5-2.0 m/sec. The articles are dried to a balanced condition for 300-315 min. After the drying process end the pasta is treated again with the humid steam for 1-2 min.

Thus the total drying period is reduced whilst the high product quality is retained.

Nazarov, N.I., Tsivitsivadze, G.V., Kabanov, V.T. et al.
Bul. 15/25.4.79. 23.12.77. as 548631 (2pp110)

Die-held pastry blanks stripper - has split-cylinder grippers articulated on common shaft and controlled by cam
MOSC FOOD IND TECHN 18.06.76-SU-375633
(06.01.78) A21b-05/02

The stripping of pastries from dies, in simplified and the distortion in the blanks is prevented using grippers which are articulated on a common shaft. Their control mechanisms comprise rods held on the platform and guided by the cam grooves.

When the conveyor of the oven stops, the platform is lifted to align the dies with the cutout blanks of pastries just beneath the grippers. The half-cylinders of the grippers surround the dies perimeter, and when the platform starts descending the grippers are slightly shifted followed by displacement of rods by the cams to press against the dies.

D12: MEAT; FISH PROCESSING

KARA/ D12 58015X/31 =DS 2501-820
Animal carcass suspension hook - with lug in hook gap for strap loop preventing unhooking by dynamic jolts
KARASS TJ 17.01.75-DT-501820
Q38 (03.01.80) =DT2501-820 B66c-01/36

Hook for running along a rail whilst supporting a side of beef or bacon, etc. via a band forming a sling, has a hanging section with lugs holding the rollers, from which the hook section extends, with a flat zone between the hanging section and the hook, in the form of a letter 'J'. The length of the flat section corresponds to the breadth of the sling, and a pointed boss projects towards the tip of the hook leaving a passage less than the breadth of the sling in its width.

The hook is of simple design, easy to handle and displace, whilst irrespective of the vibration and shaking set up, the load cannot be displaced from the hook accidentally. 17.1.75 as 501820 (8pp1045)

HOFM/ D12 07807Y/05 =DS 2529-446
Water binding capacity of meat determination - by expulsion from a porous body under load
HOFMANN K 02.07.75-DT-529446
R16 (03.01.80) *DT2529-446 G01n-33/12

The amount of water which penetrates as a result of capillary action into a porous body brought into contact with meat to be tested, during a predetermined period of time, or the air expelled thereby, is determined in a process for the measurement of the capacity of meat to combine water into its structure.

The porous body is brought into contact with the meat to be tested either under the load of a weight or by piercing the meat with a hollow rod contg. the porous body.

The process provides a method of measurement which is quicker and simpler than that using filter paper, so that a high throughput under economical conditions can be maintained. 2.7.75 as 529446 (4pp1045)

KYOW ★ D12 01977C/02 ★DT 2926-089
Pickled meat prod. prodn. - using pickling soln. contg. nitrogen di:oxide, ascorbic acid and ascorbinase
KYOWA HAKKO KOGYO 30.06.78-JA-078698
(03.01.80) A23b-04/02

Prodn. of pickled meat prod. comprises treating fresh mesh with a pickling soln. contg. NO₂ and ascorbic acid (I) and/or its alkali salts, in presence of ascorbinase (II). Pref. the soln. contains NO₂ or NaNO₂, opt. together with NaNO₃, and is used to provide 10-200(10-50)ppm. as NO₂ per kg. meat. (I) is pref. 100-600ppm. and (II) 100-1000 U per kg. meat, and the meat is esp. pickled as an emulsion of pH 5-7.

Used for the prepn. of hams, sausages, bacon, etc. Pickling time is reduced and the required colour is developed quickly. The amt. of potentially harmful NO₂ needed is much reduced. 28.6.79 as 926089 (16pp1251).

MEYN/ ★ D12 02098C/02 ★EP ---6-410
Weighing and grading fowls hanging from shackles - of moving overhead conveyor using balance arms adapted to catch and lift shackles

MEYN P 05.07.78-EP-200082
P43 R13 (09.01.80) A22c-21 B07c-05/18 G01g-19/06
D/S: E(BE, CH, DT, FR, GB, LU, NL, SW).

Weighing appts. for fowl hanging from shackles of a continuously moving overhead conveyor includes balance arms extending radially outwardly from a central shaft. The outer end of each arm is adapted to grip and lift a shackle so that it is no longer supported by the conveyor. The inner end of each arm cooperates with a load cell located in the axis of the central shaft.

The shape of the pick-up member may be adapted to the shape of the shackle and so can be used with almost any type of shackle. Since the pick-up member moves along with the conveyor no special rollers are necessary and all relative movement between the shackle and pick-up member which would cause friction and dragging is eliminated.

5.7.78. as 200082 (11pp1044).
(E) ISR: US 3997013; US 3918587; US 3642130.

LAMA/ ★ D12 02166C/02 ★FR 2420-306
Scalding cabinet for poultry, partic. geese - uses low pressure steam to scald the bird without soaking
LAMARQUE C 24.03.78-FR-009007
(23.11.79) A22c-21/04

A scalding cabinet for poultry in which the prod. is processed in an atmos. of low pressure steam, pref. contains a supporting pillar from which a bird or birds can be suspended above a reservoir of water which is evapd. by locating the cabinet over a source of heat. A removable hood pref. holds the vapour around the suspended poultry.

As a safety measure, to prevent the poultry contacting the hot water, a grill is pref. interposed between the suspended poultry and the surface of water in the reservoir. Heating beneath the reservoir can be provided by a gas burner, oil burner, electric heating elements, solid fuel hearth etc. The heater can be fixed beneath the cabinet to travel with it as a self-contained unit. 24.3.78 as 009007 (5pp448)

META- ★ D12 02167C/02 ★FR 2420-307
Multi-needle machine to inject brine into meat - maintains constant injection pressure when adjusted to large or small deliveries
METALQUIMIA SA 20.03.78-ES-468071
(23.11.79) A23b-04/02

The machine is of the type in which needles extend from a manifold which is fed with brine by a reciprocating piston pump. The piston is driven by direct coupling to the ram of an hydraulic power cylinder.

Displacement of the ram, and hence the piston, is controllable by an hydraulic regulator, partic. one which can apply actuating fluid to either face of the ram as required. This provides control of the volume of brine delivered by the piston pump without varying the pressure at which the brine is injected.

Given constant pressure ram actuation, the pump delivers at constant pressure no matter whether max. vol. is

injected or only a small proportion of that vol. 20.3.79 as 006964 (8pp448)

RHEE ★ D12 02227C/02 ★GB 2023-990
Device for feeding ribbon of sausage clip loops - to clip attachment appts. with reciprocating drive pin mechanism
RHEEM MFG CO 03.07.78-US-921251
(09.01.80) A22c-11/12

Appts for feeding a continuous ribbon of loops to a clip attachment appts also separates a individual loop from the ribbon on proper positioning w.r.t. the clip attachment appts.

Appts. includes a guide track for the ribbon and a movable ribbon guide pin. A follower and cam track are used to position the pin transversely to the guide track and to move it into and out of engagement with a ribbon in the guide track. A reciprocating drive incrementally advances the pin which engages the ribbon to drive it from a null to an advance position, and then disengages the pin and retracts it to the null position.

Appts is used partic to advance a ribbon of clips to a sausage clipping appts. Process is fully automated. 23.5.79 as 018026(8pp295).

FLET- ★ D12 02229C/02 ★GB 2023-992
Method and apparatus for washing animal bungs - by engagement on radial support supplying wash water
FLETCHER W&R NZ 30.06.78-NZ-187739
(09.01.80) A22c-13

Animal casing such as a bung is washed by placing the casing on a support which extends through its interior. A duct in the element introduces washing liq into the interior of the casing under pressure.

Pref. there are a series of supports projecting radially from a hub to which is supplied the washing liq. The hub rotates and carries the casings from a loading station, through a wash station to a discharge station where pref the casing are turned inside out.

Used for mechanically washing animal bungs eg sheep bungs, from which the crowns have been severed. Method permits the processing of large numbers of casings on a prodn-line basis. 21.6.79 as 021682(9pp295).

LEME= ★ D12 03224C/02 ★SU -659-122
Meat prod. e.g. sausages, handling unit - has frame traverses with lugs in vertical and inclined sections for hanging pins
LENGD MEAT DAIRY 06.01.77-SU-441316
(30.04.79) A22c-15

Handling of sausages for heat treatment is mechanised with each traverse bevelled at its ends between vertical and horizontal sections. It has nests for the passage of manipulator grippers, and supports for rods carrying the sausages.

The vertical and the inclined sections have lugs for pins, and the width of the lugs in the inclines exceeds maximum diameter of pins, while the lugs of the vertical section are of the same size as the pins.

Kozlov, Yu.A., Kulinich, V.V., Bashilov, I.S. Bul. 16/30.4.79. 6.1.77. as 441316 (4pp89)

FARE= ★ D12 03225C/02 ★SU -659-123
Fish dresser knife setter - has variable frequency generator with contacts connecting stepping motor and sensor
FAR-E POLY 11.03.74-SU-004383
(30.04.79) A22c-25/14

Change-over of setting ensuring accurate dressing of fishes is controlled by a variable frequency pulse generator connected to the motor and the feeler.

The setting is carried out to match the length of the handled fishes, and the displacement of the disc knife opening up the belly is determined by a formula which takes into account the length of the fish.

The knife is fed by a stepping motor whose angle of turn is controlled by the pulses of the generator with contacts closed by the feeler sensing the fish.

Proskurenko, I.V., Sobchenko, V.V., Tokmakov, V.M. et al. 11.3.74. as 004383 (3pp89)

IRE = ★ D12 03226C/02 ★ SU-659-124
 h processing machine decapitating unit - has one stationary and
 e movable on base cutter guides controlled by separate drives
 ing photodiodes acting as limit switches
FAR-E POLY 13.10.75-SU-181437
(30.04.79) A22c-25/14
 mproved efficiency of the fish decapitating unit, and low-
 power intake for the drive of the cutter are due to two
 lides, one of which is stationary while the other one is
 movable on the base. The shift is controlled by a separ-
 e drive.

The head of the fish placed on the chute is clamped by
 presser plate so that the gill cover of statistically
 average fish is in line with the disc knife.

The fish is pushed against the flap carried by the shaft
 resolver the output of which is proportional to the size
 the fish to control the position of the cutter. The sett-
 ing is dependent on signal of two photodiodes acting as
 limit switches, and interacting with a flap so that the
 mean position of the cutter coincides with the two limit
 switches in the off-state.

 sh dresser setting unit - comprises size sensor on vertical rod
 articulated to bell crank and slotted lever
TEKHRYBPROM PRODN 01.03.77-SU-457354
(30.04.79) A22c-25/14

The range of fish sizes handled by the unit when aligning
 along the line of head cut, is increased and its design
 and reliability are improved if the pusher and the size
 feeler are interlinked.

The feeler is carried by the vertical rod which is
 connected to the pusher by two articulated levers, one in
 the form of a bellcrank. The other lever has a slot for
 pin of the adjustable support, and the ratio of lever arms
 corresponds to the ratio of length and width of the fish.

Heat treatment of foodstuffs etc. - in sealed steam chamber operating at sub atmospheric pressure with cooling in situ (BR 4.12.79)

KIBLEUR P P M 17.05.78-FR-014549

+P34 (09.01.80) A23b-04 A23b-07 A23l-03 A61l-02/06

D/S: E(BE, CH, DT, GB, IT, LU, NL, SW).

Continuous thermal treatment of bulk, loose, prepacked or packaged prods. uses a sealed treatment chamber. Before introducing the goods to be treated, the walls of the container are heated above the temp. to which the goods are to be heated. The prods. are then introduced into the vessel, which is then sealed and placed under vacuum. Steam is then introduced at subatmospheric pressure, which is maintained until the desired treatment has been achieved. The pressure is then reduced until the desired utilization temp. has been attained.

The process can be used for precooking, pasteurisation, sterilization or blanching of foodstuffs and other prods. The process allows thermal treatment of meat, poultry, vegetables, etc., followed by rapid cooling in the same sealed chamber, thus preventing intermediate contamination of the prod. and avoiding the prodn. of large volumes of polluted water, as in prior art processes.

 /S: E(CH, DT, FR, GB, IT, LU, NL, OE, SW).

measure of cereal to be cooked is mechanically fed into
 the cavity of a heated mould. A die is advanced to close
 the mouth of the cavity and to pot the cereal under press-
 ure while it is cooked, die movement and pressure being
 derived from a fluid power cylinder. Die pressure is
 relieved by retracting the piston of the fluid power cylind-
 er, but the die is held in position to close the mould by a
 locking device. The locking device is released, the mould
 opened and expanded prod. is mechanically discharged.

The appts. is used for prodn. of expanded, pressure
 cooked cereal foods. The use of a fluid power cylinder to
 displace the die obviates the previous cam mechanism
 which was prone to rapid wear so that mould closure and
 cooking pressure became unreliable, with consequent loss
 of prod. quality. The fluid power operation provides a
 machine which is cheaper to mfr. and to maintain than
 previous machines employing cam mechanisms.

 Machine to open eggs individually and collect contents - combines
 hygiene with industrial scale capacity
 DIGEOS J 21.03.78-FR-008194
 (23.11.79) A23j-01

The machine is of the type in which each egg is held in a
 vertical position while the tip of its base is cut off. The
 top of the egg is then perforated and low pressure air blown
 in to discharge the contents through the hole in the base.

The improvement is that the holding device to convey
 eggs through the machine comprises a flat plate with a
 number of spaced, egg-locating holes. The dia. of each
 hole is such that the egg can sit almost half-way down into
 the hole without passing through. On the egg-receiving
 side of the plate, spaced, spring gripper blades rise around
 each hole. The blades are inclined slightly inwards towards
 the axis of the hole.

Used for breaking eggs for industrial bakeries and con-
 fectionery factories. Eggs are handled individually and

contents do not contact shell exterior. This ensures main-
 tenance of hygiene standards combined with industrial
 scale productive capacity. 21.3.78 as 008194 (17pp448)

 Fractionation of tallow by crystallisation - to give three portions
 including cocoa butter analogue
 US SEC OF COMMERCE 14.04.77-US-787660
 (09.01.80) *BE-865-992 C11b-07
 Tallow is fractionated into 3 distinct fraction comprising a
 hard, high-melting solid fraction; a plastic solid having the
 physical and thermal properties of coca butter; and a liq.
 oil fraction.

Fractionation is achieved by dissolving the tallow in a
 suitable solvent, feeding the soln to ≥ 1 crystalliser, cir-
 culating the soln. through the crystallisers at a preselect-
 ed steady-state crystallisation temp range, and crystalli-
 sing out the hard, high-melting solid. The crystallisation
 filtrate is circulated through the crystallisers at a second
 preselected steady-state crystallisation temp range, and
 the plastic solid crystallised out. The solvent is removed
 from the filtrate obtd to form the liq. oil fraction.

The process continuously feeds solubilised tallow to the
 crystallisers and removes the crystallised prod. The no-
 minal residence time of a soln. in the crystallisers at any
 preselected steady state crystallisation temp is limited $\leq$
 10 mins. 12.4.78 as 014364 (7pp931).

KAO SOAP KK (TOXO) 15.05.78-JA-057430
(28.11.79) A23I-01/21

The method is effected by immersing fruits or vegetables in the aq. alkaline soln., in which (a) 10-18C satd. or un-satd. fatty acid and (b) ≥ 1 nonionic surfactants having HLB 6-18 selected from polyoxyethylene-sorbitan fatty acid ester, sucrose fatty acid ester, sorbitan fatty acid ester, glycerin fatty acid ester and propyleneglycol fatty acid, are combined.

Fruit (e.g. orange, peach, apple, plum, grape, pear, persimmon, etc.) and vegetables (e.g. tomato, cucumber, raddish etc.) can be smoothly peeled at relatively low temp. in a short time with high yield and low breakage rate, and the peeled fruit and vegetables have excellent tissue shape and colour. Further having high alkali concn. the waste water from conventional peeling processes has been difficult to treat by activated sludge process. The waste water from the peeling process described can be pretreated by calcium-precipitation process and the pretreated waste water can be easily treated by activated sludge process. 15.5.78 as 057430 (5pp5)

KAOS ★ D13 02691C/02 ★J5 4151-155
Peeling fruits and vegetables - by immersing in aq. alkaline soln. contg. an opt. unsatd. fatty acid and a phosphorus cpd.

KAO SOAP KK (TOXO) 15.05.78-JA-057431
(28.11.79) A23I-01/21

Method comprises immersing fruits or vegetables in an aq. alkaline soln., in which (a) 0.005-1.0 (0.1-1.0) w/w% of 10-18C (un)satd. fatty acid and (b) 0.005-1.0 (0.1-1.0) w/w% of ≥ 1 P cpd. selected from orthophosphate, metaphosphate and the condensed phosphate having 2-6 P atoms.

The fruits and vegetables are effectively peeled by immersing them in the aq. soln. contg. the fatty acid and

phosphate. As orthophosphate, M_3PO_4 , M_2HPO_4 and MH_2PO_4 (M is Na, K or NH_4) are used and as metaphosphate $NaPO_3$ or KPO_3 are used. As the 2-6P condensed phosphate -alkali metal pyrophosphate, sodium trimetaphosphate, sodium hexametaphosphate or sodium tripolyphosphate are used. The aq. alkaline soln. is prepd. so that it contains alkali (e.g. NaOH) 0.1-1.0 (0.2-0.5) w/w% and the conc. used is lower.

Fruits (e.g. orange, peach, apple, plum, grape, pear, persimmon, etc.) and vegetables (e.g. tomato cucumber, raddish, etc.) can be smoothly peeled efficiently at relatively low temp. in a short time and the peeled fruits or vegetables excellent in flavour, gloss and tissue, are obtd. 15.5.78 as 057431 (5pp5)

Water-soluble and dispersible para-caseinate prepn. - by treating para-casein obtd. from calcium caseinate or rennet casein with alkali metal salt and hydrogen peroxide and drying

KIMURA M 17.05.78-JA-057602
(28.11.79) A23I-03/02

The method comprises treating (a) paracasein obtd. by treating water soluble and dispersible calcium caseinate with rennin or (b) rennet casein with aq. mixed soln. contg. neutral alkali metal salt and a little H_2O for absorbing the soln. 20-30% in (a) or (b), with swelling, and drying 200-300°C in a pneumatic dryer. The drying can be practised using more efficient pneumatic dryer and prod. can be prepd. more economically. Specifically, the pneumatic drying is operated at 200-300°C with an air stream velocity of 20-40 m/sec. under reduced pressure. Paracaseinate can be dried economically in 1-5 seconds with high efficiency. The aq. 2% soln. of thus obtd. neutral alkali salt of paracasein shows ~ 100 times larger viscosity than that of the aq. 2% soln. of neutral alkali salt of acid casein. The powdery paracaseinate is almost germfree, tasteless, odorless and white substance. 17.5.78 as 057602 (3pp5)

Sweet confection e.g. candy mass prodn. - includes spraying sugary syrup in hot air stream and using second hot air stream to create turbulent conditions

KAZAN ZARYA 07.06.76-SU-369415
(15.04.78) A23g-03

Sweet confection is produced by spraying a sugary syrup in a stream of heated air.

This process is intensified and the quality of the product is improved by introducing the first air stream contg. fine syrup droplets (aerosol) into a second air stream (or another gas), whose velocity does not exceed that of the first stream (usually is much less). As a result, a turbulent air stream is formed in which water is rapidly evaporated from the syrup droplets (in a fraction of a second).

R26 (07.03.79) G05b-15

Means of controlling a servo mechanism with the aid of computing means can be used as a back-up process for direct digital control of a technical operation, and represents an improvement on Parent Cert. No. 560209.

The improvement consists of introducing means of distinguishing polarity as well as level of the useful difference signal, making the unit more versatile in practical applications where polarity frequently varies. Threshold comparator receives feedback information from slave sensor and instructions from calculating unit, and in turn from simple on-off type regulator where unit works to a more complex control law. Both these receive commands from setter.

The innovation consists of introducing a polarity discriminator into the output from controlling comparator, to decide whether the plus or minus output to adder is required. Adder has one add input from regulator; the function of calculating unit (3) is to decide whether outputs together require addition or subtraction for the best approximation to the optimum law.

Unit gives this command to the control input of selector gate and one or other line to adder results in addition or subtraction. The result goes via converter, producing a non-electrical signal, to slave device which is the object of the optimum-law servo action. Preserved dry tea prod. contg. milk prodn. - includes two-stage extrn. of tea leaves with water and milk addn. in sealed vessel, filtration and drying

AS USSR BIOCHEM 30.12.76-SU-436720

(30.04.79) A23c-09/10 A23f-03

Preserved tea product is prepd by introducing hot milk into a tea extract, keeping the mixt. aside for some time, and then preserving it.

The quality of the product is improved by cooling it, before the preservation, to 8-10°C over 30-60 min; keeping it at this temp. for 4-5h; and filtering. All the operations before the filtration are carried out under hermetic conditions.

The tea is extrd. with water at 97-100°C (the ratio tea: water is 1:10 to 1:13). Natural milk heated to 90°C is then introduced. The mixt. is cooled to 8-10°C and kept at this temp. for 4-5h. to effect the second stage extraction of the tea.

The product is sterilised and preserved in hermetically sealed containers. Alternatively, the product can be

concentrated or fully dried by sublimation. The milk can be partly replaced by a juice, e.g. beetroot, carrot, strawberry or apricot juice.

A machine for mincing, chopping or similarly size-reducing a prod, partic. a food prod., employs a rotary cutting or pressing tool. To reach the tool, the prod. has to be passed through axial holes in a centrifugal rotor keyed coaxially to the tool shaft. The rotor has an annular collecting channel surrounding the axial holes and is designed to catch items flung outwards by the centrifugal rotor, esp. metal inclusions.

The collecting channel is pref. located on the circumference of the centrifugal rotor. The channel is pref. integral with the rotor, e.g. in the form of a channeled flange around the circumference of the rotor.

The machine is a rotary mincer, chopper, etc., for size-redn. of food prods., partic. meat.

Agricultural prod. e.g. vegetable and flower seed dryer - has crumpling rollers between conveyor drive and plate sepn. roller and system of brush rollers

AGRIC ELEC RES INST 17.02.77-SU-453402
Q76 (25.04.79) F26b-17/26

The dryer contains a drying chamber which contains several air permeable platforms and endless conveyor provided with a drive.

To increase the drying quality, the chamber is additionally provided with crumpling rollers placed between the platforms and connected to the conveyor drive. The dryer is also provided with separation roller with a stationary deck, placed under the platforms, and a system of brush rollers fitted on the conveyor.

The humid seed from the bunker is supplied to the upper drying platforms through the batching distributor. The seed is continuously displaced by the conveyor to the lower drying platform and is then unloaded.

Fruit comminuting appts. - has shaft carrying discs with knives and spiral guide blades, under guides and pressure strips

N-CAUCASUS ORCHARDS 01.03.77-SU-457995
(30.04.79) A23n-01/02

The appts. comprises a receiving hopper and a casing with a vertical shaft carrying a rotatable disc with comb-shaped knives and auxiliary discs of similar shape and mounting blades in a spiral around the edges. Over each disc are guides and strips in planes parallel to the plane of the discs and displaced relative to the knives.

The guides are at an angle to the discs and the height of the knives of each disc reduces along the fruit path of travel. The strips are pref. displaced by 5-75° relative to the knives.

The blades provide better transportation of the fruit, while the strips prevent the fruit rotating together with the discs and press them against the knives.

 Centrifugal separator for suspensions - has discharge openings lined with inserts made from hard and wear-resistant material
 PLAVSK SMYCHKA 26.04.77-SU-481437
 J01 P41 (30.04.79) B04b-01/10

Improved efficiency of separation and increased reliability of operation of the centrifugal separator for the food and the microbiological ind. is ensured by provision of self-cleaning discharge nozzles. The latter, rectangular or segmental in cross-section, are located at uniform distances along the periphery of the moveable plunger which forms the bottom of the rotor's chamber and is normally pressed against the sealing ring on the rotor's lid. The openings of the discharge nozzles consist of grooves in the inserts fixed into the wall of the plunger. The inserts are made from wear-resistant material, pref. hard alloy. The top of the opening is formed by the surface of the sealing ring into which can also be fixed inserts from material more wear-resistant than the material of the sealing ring. In the separators for some non-abrasive suspensions, the discharge nozzles can be made in the plunger without hard inserts.

 Filtration of suspensions, esp. for drinking water - by filter bed in suspended element permeable all round
 HOECHST AG 19.06.78-DT-826631
 J01 (03.01.80) B01d-23/12

A filtration medium is filled into a sack-like, suspended element forming part of an arrangement for the filtration of suspensions. The element is permeable to fluids all round, and is formed by a fabric woven from a material which is chemically and mechanically highly resistant. The suspension is delivered via a pipeline which opens into the middle of the element and dips into the filtration medium. The penetration of the pipe outlet is adjusted so that the height of the filter bed below it is at least half the dia. of the filter bed.

Used to make the filtration more efficient and to provide technical conditions which are more favourable. The filter bed does not choke so readily and the medium does not have to be changed so frequently. Backwashing requires less water and when the filter bed has to be changed it can be taken out as a unit. 19.6.78 as 826631 (8pp1045).

 Dewatering and solidifying compsn. for sewage sludge - contains
 mixt. of cement, ferric chloride and calcium hydroxide, and mixt. of
 cement, aluminium hydroxide and calcium sulphate
 FUJISASH IND KK 15.05.78-JA-056612
 L02 (22.11.79) C02c-03 C04b-13
 compsn. comprises inorganic coagulating component (I)
 and solidifying component (II). (I) comprises 100 pts. wt.
 cement, 5-30 pts. wt. FeCl_3 and 10-60 pts. wt. $\text{Ca}(\text{OH})_2$,
 and (II) comprises 100 pts. wt. cement and 10-40 pts. wt.
 a mixt. comprising $\text{Al}(\text{OH})_3$ and CaSO_4 in a wt. ratio of
 1 to 1/4.

The cement is e.g. Portland cement, alumina cement
 mixed cement etc., and the CaSO_4 is, e.g. anhydrite,
 hemi-hydrate or gypsum etc. The amt. of the compsn. to
 be used is 70-250 (100-250) wt. % based on solid content of
 the sewage sludge to be treated. The sewage sludge is
 effectively dewatered by subjecting it to vacuum dewatering
 treatment after adding the compsn. 15.5.78 as 056612
 (pp34)

HI★ D15 02355C/02 ★J5 4149-257
 Treating waste water sludge by compression dewatering - involves
 adding a nonionic polymer coagulant and basic aluminium chloride
 and filtering
 ISHIGAKI KIKO KK 13.05.78-JA-057423
 (22.11.79) B01d-21/* C02c-03

treatment of sludge contg. colloidal organic components,
 resulting from treatment of sewage or industrial waste
 water, by compression dewatering appts., the improve-
 ment comprises adding a nonionic polymer coagulant and
 basic Al chloride, followed by thoroughly mixing together
 and filtration, so that flocculated matter is improved in
 strength and filter cloth is not blocked with it in compress-
 ion filtration, and further the amt. of the treating agent is
 saved largely cf. conventional art where Fe chloride or
 $\text{Al}(\text{OH})_3$ etc. is used as the coagulant, thereby the amt. of
 filter cake is decreased.

The amt. of basic Al chloride to be added is 1-1.5 w/v
 % against the sewage sludge, and the amt. of the nonionic
 polymer coagulant is about 0.3-0.4% w.r.t. solid content
 of the sewage sludge. The filter cake is easily peeled from
 the filter cloth and its water content is 70-80%. 13.5.78

KUBI★ D15 02356C/02 ★J5 4149-258
 Dewatering of sludge from effluent treatment - preheating by
 adding acid, oxidising agent and inorganic coagulant
 KUBOTA KK 15.05.78-JA-059198
 (22.11.79) B01d-21/* C02c-03

In dewatering of sludge resulting from treatment of effluent,
 e.g. sewage, night soil and org. industrial waste waters,
 etc., the improvement comprises adding acid, e.g. H_2SO_4
 etc. followed by stirring and subsequently adding oxidising
 agent, e.g. H_2O_2 etc. and inorg. coagulant, e.g. Ca salt
 and FeSO_4 etc., prior to the dewatering. This improves
 dewaterability of the sludge so that filter cake having low
 water content is obtd.

In an example, 24.8 DS% of 97%- H_2SO_4 was added to
 sewage sludge (solid concn.: 4.3%; suspended solids:
 41,500 mg/l, pH: 7.25; 1 g loss: 49.8%; M-alkalinity:
 3.710 mg/l as CaCO_3), followed by stirring at 120 r.p.m.
 for 2 mins. 10 DS% of FeSO_4 , 9DS% of H_2O_2 and 15 DS%
 of CaO are simultaneously added thereto, followed by
 stirring for 10 mins. at 120 r.p.m. and then 3 mins. at
 50 r.p.m. The sludge thus treated was then filtered by
 means of filter press at filtration rate of 9.0 kg.ds/m².
 HY, and pH of filtrate was found 5.0. 15.5.78 as 059198
 (3pp34)

SANK★ D15 02357C/02 ★J5 4149-260
 Seeding agent for activated sludge treatment of waste water -
 giving accelerated growth, improved supply of nutrients etc.,
 comprises excrement of earthworm
 SANKYO AGENCY KK 13.05.78-JA-056902
 (22.11.79) C02c-01/02

Seeding agent suitable for use in operation and mainten-
 ance of biological waste water treating appts., e.g. activ-
 ated sludge treating appts., trickling filters, contact ox-
 idn. treating appts. and rotating disc treating appts., etc.
 capable of accelerating growth of activated sludge, dedi-
 mentation of sludge, supply of nutrients as well as adjust-
 ing bulking, comprises excrement soil of earthworm.

A polluted water contg. organic matter $\text{NO}_2\text{-N}$, sulphide,
 ammonia, phosphoric acid, oil components, floated matt-
 er etc. is effectively purified by passing it through lamin-
 ated layer of earthworm excrement soil. The activated
 sludge used in treatment of food-processing waste water
 is largely improved in its properties by adding the earth-
 worm excrement soil, and settlability of sludge is im-
 proved and further it exhibits strong seeding effect.

TAJA★ D15 02359C/02 ★J5 4149-264
 Waste water treating appts. - where hydrochloric acid is
 electrolysed using aluminium electrodes to give activated
 aluminium and hydrogen for addn. to waste water
 TAKAOKA ELECT MFG KK 16.05.78-JA-057125
 J03 (22.11.79) C02b-01/82 C02c-05/02

A waste water treating appts. using electrolysis is claimed in which waste water is not directly electrolysed in electrolysing vessel. Electrolysis of HCl soln. is effected in an electrolysing vessel provided with Al anode and Al (or insoluble) cathode to form activated Al and hydrogen bubbles, and the HCl soln. contg. the activated Al and a large amt. of hydrogen bubbles is then added to waste water to be treated to rise by coagulation floatation polluting matters to the surface of the water.

By this process, adhesion of deposits or sticky mud to the electrode is effectively suppressed; it is not necessary to increase the volume of electric installations and to carry out cleaning of the electrode and further the volume of electric source is decreased due to the fact that HCl exhibits higher electro-conductivity than that of water. 16.5.78 as 057125 (3pp34)

TAKE- ★ D15 02549C/02 ★ J5 4150-369
Solidification of waste contg. heavy metal cpds. etc. - by addn. of hydraulic cement, metal sulphate, alkali metal (bi)carbonate or silicate and sewage sludge ash

TAKENAKA DOBOKU KK (TKEN) 17.05.78-JA-059643
J02 (26.11.79) B01j-01 C02c-03 C04b-07/35 C04b-29

Solidification of waste matter (I), comprises addn. of hydraulic cement (II), (A), (B) and (C) into (I). (A) is Al sulphate, alum, ferrous sulphate and/or ferric sulphate. (B) is carbonate, bicarbonate and/or silicate or alkali metal. (C) is ash of sewage-sludge.

The elution of harmful cpds. such as heavy metals, pesticides, etc. from (I) can be prevented by solidification. When (I) contains large amts. of the cpds. which interferes with the solidification of (II), or when sufficient amt. of Ca oxide to be converted to Ca hydroxide by hydration is not contained in (C), hydroxide or oxide of alkali earth metal is added to (I) with (II) (A), (B) and (C). The wt. ratio of (A) to (B) and (C). The wt. ratio of (A) to (B) is stoichiometric. The sum of the quantities of (A) and (B) is 5-30% on the quantity of (II). 17.5.78 as 059643 (11pp)

KAWJ ★ D15 02639C/02 ★ J5 4150-843
Rendering hide treatment sludge harmless - by indirectly heating to dry, calcining under non oxidising atmos., and solidifying ash using asphalt

KAWASAKI HEAVY IND KK 16.05.78-JA-057774
(27.11.79) B01j-01 C02c-03

A hides sludge resulting from treatment of hides in tannery, i.e. water-washing, depilating, ash-removing, pickling and tanning treatments of hides, contg. wasted hides, Cr component, $\text{Ca}(\text{OH})_2$, sludge by flocculation, activated sludge and crude protein etc., is made harmless while suppressing formation of Cr^{6+} by the following steps. Process comprises drying the hides sludge by indirect heating system, calcining the dried hides sludge at 200-500°C under non-oxidising atmos. by indirect heating system, and subsequently solidifying the calcined ash thus obtd. with asphalt.

Conversion of Cr^{6+} into Cr^{3+} is effectively suppressed and organic matter, esp. feather causing lowering in strength of solidified product is carbonised; the solidified prod. is suitable for use in land fill without any dissolution of Cr^{6+} ; it becomes possible to use as the heat source steam or heating oil medium due to low temp. calcination. 16.5.78 as 057774 (3pp34)

KOBM ★ D15 02640C/02 ★ J5 4150-844
Dewatering of sewage sludge by centrifuging - after addn. of cationic organic polymer coagulant and alkali metal salt

KOBE STEEL KK 16.05.78-JA-058575
A97 P41 (27.11.79) B01d-21/* B04b-01 C02c-03

A sludge discharged from municipal sewage works is dewatered by centrifuging after adding a cationic organic polymer coagulant, e.g. water-soluble aniline resin hydrochloride, polythiourea acetate, polyethyleneaminotriazol, polyvinylbenzyltrimethylammonium chloride, polyethylene amine and vinyl pyridine copolymer salt etc., and an alkali metal salt, e.g. NaCl , Na_2SO_4 , Na_2CO_3 , KCl and LiCl etc., the amt. of which is < 100 (pref. 25-100) wt.% of the coagulant.

Recovery of solid component is very high and the water content of dewatered cake is very low. The necessary

amt. of the metal salt added is very small; the amt. of coagulant is also economical. The alkali metal salt removes hydrated water taken into sludge by formation of flocs by the action of dewatering ion, e.g. Na^+ , K^+ and Li^+ etc. 16.5.78 as 058575 (5pp34)

HITA ★ D15 02641C/02 ★ J5 4150-845
Removing organic cpds., ammoniacal nitrogen and solids from effluent - using granular activated charcoal packed between pair of supporting electrodes

HITACHI KK 16.05.78-JA-057211
(27.11.79) C02b-01/82 C02c-05/12

Organic matters, ammoniacal nitrogen and suspended solids are effectively removed from effluent by passing it through a treating vessel in which granular activated charcoal having a granular size of > 5 mm is packed between supporting electrodes comprising > 1 pair of anode and cathode, simultaneously applying DC to cause polarisation of the granular activated charcoal and generate fine air bubbles by the action of which suspended solids in the effluent are floated to the surface of the water and overflowed to the outside of the system, ammonium ion being fixed on the polarised granular activated charcoal and the organic matters being also adsorbed on them.

Appts. for treating the effluent comprises upper suspended solids-floating region at which are provided rectifying plate, overflowing weir and effluent inlet and lower electrolysis region at which are provided the supporting electrodes and the granular activated charcoal packed in layered form. 16.5.78 as 057211 (5pp34)

HITA ★ D15 02642C/02 ★ J5 4150-846
Ammoniacal nitrogen-contg. effluent treatment - by passing through electrolysis vessel contg. granular active charcoal between electrodes and passing DC

HITACHI KK 16.05.78-JA-057212
J03 (27.11.79) C02c-05/12

NH_4^+ -N is effectively removed by adsorption from effluent and decomposed to N_2 by electrolysis by passing the NH_4^+ -N-contg. effluent through electrolysing vessel in which granular activated charcoal having a granular size of > 5 mm is filled between supporting electrode constituting pairs of anode and cathode and simultaneously applying D.C.

The used activated charcoal is reproduced in its activity by contacting it with electrolysing liquor. Each of the granular activated charcoal filled between the supporting electrodes is polarised, and NH_4^+ in the effluent is sorbed on the activated charcoal by catalytic and electrostatic neutralising effect. In this case, NH_4^+ is decomposed until to N_2 under high electric voltage to be applied. 16.5.78 as 057212 (8pp34)

Removing ions of non-ferrous metals from waste water - by blowing with air in presence of sorption agent of long chain alkyl di:eth amino-phenyl iodide

ODESS UNIV 07.12.76-SU-426897

(29.04.79) C02c-05/02

Non-ferrous metal ions are removed from wastes by sorption and flotation, and the cost of the process can be reduced if the sorption agent used is a long chain 1-alkyl-2-(N-diethylaminophenyl) quinoline iodide. This reagent is obtd. as a waste product from coke-processing, and does not have to be synthesised, as did the previous reagents aliphatic amines or quaternary ammonium salts.

Waste contg. 50 mg./l. Mo as molybdate ions was treated with a 1% soln. of 1-heptyl-2-(N-diethylamino-phenyl)quinoline iodide in a ratio of 15 ml. reagent to 20 ml. waste, while air was blown through for 10 min. and the foam was sepd. The vol. of the foam fraction was < 1 ml. and the cleaned waste contained only 5 mg./l. Mo. Skrylev, L.D., Purich, A.N., Obdeenko, S.N. Bul. 15/25.4.79. 7.12.76. as 426897 (2pp815)

Multistage evaporator installation for thermal power stations contains independently fed evaporator connected to secondary steam pipeline of evaporation unit, and additional feed-water preheater

MOSC POWER INST 25.07.77-SU-511460

J01 Q51 (30.04.79) C02b-01/02 F01k-07/40

Increased efficiency of the multistage evaporator installation for thermal power stations is ensured by provision of the possibility to obtain from it a supplementary distillate without increasing consumption of the heating steam, as well as the possibility of feeding the installation with several streams of the feed-water of diverse salt composition. For this purpose, the installation is equipped with independently fed evaporator connected to secondary steam pipeline of at least single stage of evaporation, as well as with additional feed-water preheater connected to the feed-water channel and to the evaporator.

The feed-water channel transfers the water consecutively through a set of feed-water preheaters before the water enters the first stage of evaporation which also receives heating steam. Here, part of the feed-water

aporates and the rest passes to the next stage of evapn. with secondary steam. The latter is also fed to feed-water preheaters and to independently fed evaporator which is supplied by additional pipeline with feed-water of different salt compsn. than the feed-water fed to the set other evaporators. The water fed to the additional pipeline can consist of effluents and can pass through additional preheater which is then supplied with secondary steam which also passes through independently fed evaporator and through additional preheater. The distillate formed by condensation of the heating steam in the stages of evaporation, and in the independently fed evaporator, is used as make-up water in the thermal power station. Water desalination and recirculation systems - using surfactants, thermal and ultrasonic treatments to prevent scale formation
DONETSK FERR METAL 30.08.77-SU-521554

MA97 G04 (30.04.79) C02b-05
Formation of deposits of scale in water recirculation system or sea water thermal desalination units etc. can be prevented or reduced by addn. of surface active agents to the water followed by thermal treatment.

The hard salts remaining in soln. stabilised by the surface active cpds., can be removed as a crystalline ppt. if the water is also subjected to ultrasonic radiation of frequency 18-35 k.Hg. for a few sec.

This breaks down the adsorbed layer of surface active cpds. on the surface of the salts, and allows formn. of centres of crystallisation, resulting in pptn. of calcium phosphate as a crystalline deposit.

Water contg. 8.3 g./l. total salts and 4.15 g./l. calcium sulphate was treated with 5 mg./l. sodium carboxymethylcellulose (or 15 mg./l. n-pentanol) and heated to 50°C, then subjected to ultrasonic radiation at 20 kHz.

for 30 sec. The salts in soln. pptd. as a readily removable crystalline deposit, and the calcium sulphate content was reduced to 2.6 g./l. (or 2.68 g/l.). Water subjected to heat treatment only, gave a heavy scale deposit on evapn., while the above water did not.

Sedoruk, T.Ya., Malko, S.V., Pilipenko, V.L. et al. Bul. 16/30.4.79. 30.8.77. as 521554 (2pp815)

Chemical purificn. of waste water - includes multistage treatment with activated sludge with specified aeration to remove suspended organic materials

LENGLD ENG-CONS INST 27.12.76-SU-437625
(30.04.79) C02c-01/02

Colloidal organic material can be removed from waste by aeration in presence of activated sludge, and the efficiency of the process can be increased if sludge from the first stage is regenerated prior to being passed on for use in the second stage, from where it is returned to the first stage. A similar procedure is followed in subsequent stages, if more than 2 are used, the sludge being passed in the direction of increased concn. of contaminants. The method is more efficient than that using recycle of sludge from the second to the first stage in a closed cycle, and is suitable for waste with a high BOD of >300-400 mg. O/l., such as is obtd. in processing milk, meat and fish. The size of aeration plant required can be reduced by 15%, and the air consumption is reduced by 22%. Aerator for surface layers of effluents - contains vibrator with rigidly connected conical chamber having open wide base immersed in liquid and vertical narrow discharge nozzle
AS UKR MECHANICS 10.11.77-SU-563231
(30.04.79) C02c-01/10

Improved efficiency of aerating the surface layers of liquids, e.g. saturating the effluents with oxygen from the air for their biological purification, is ensured by the following features of the design. The aerator contains a conical chamber immersed in the liquid up to its narrow base connected to vertical pipe serving as discharge

nozzle. The conical chamber of the aerator is rigidly fixed to the vibrator which causes its reciprocal vertical motion with frequency 36 Hz. This produces pumping action and the stream of liquid flowing upward from the discharge nozzle and returning to the liquid together with bubbles of captured air.

The air-bubbles are typically of 0.5-1.0 mm. in diameter and with long retention time in the liquid (1-2 min) become well dispersed init.

Prepn. of a reagent for the diagnosis of *Staph. aureus* comprises (a) sensitising the red blood corpuscles of an animal with a serum contg. reactive immunoglobulins with respect to protein A and having an anti-red corpuscle activity for the animal; (b) addn. of glutaraldehyde to the sensitised prepn. and (c) lyophilisation of the prepn.

Stable reagent having high sensitivity for the determination of *Staph. aureus* by haemagglutination. The diagnosis is very rapid about 30 secs. per test. Known reagents are unstable difficult to prepare or give slow response times.

The sensitisation in stage (a) is generally effected at 37-40°C for 1-2 hrs. and stage (b) is effected at 37-40°C for 10-15 hrs. after glutaraldehyde addn. Pref. the temp. is 40°C, 0.0025-0.01 vol/vol. % of glutaraldehyde is used; the red blood corpuscles are sheep corpuscles and the serum used for the sensitisation is rabbit anti-sheep red blood corpuscle serum. 24.3.78 as 008748 (10pp395)

Microbiological oxidn. of organic cpds. - with methane-utilising *Methylosinus trichosporium* bacteria

IMPERIAL CHEM INDS LTD 11.05.79-GB-016345 (16.05.78-GB-019712)

E19 (09.01.80) C07b-29

Organic cps (I) are oxidised with the methane-utilising bacteria *Methylosinus trichosporium* (or an extract of this species). (I) are suitably 5-16C alkanes, 3-16C aliphatic alcohols, 3-8C alkenes, or a cyclic organic cpd.

M. trichosporium oxidises a very wide range of (I) at high (80-90%) conversion efficiencies. Thus PhH is oxidised to PhOH, propylene is oxidised to propylene oxide, and p-xylene is oxidised to 4-methylbenzoic acid, etc.

Determn. of dielectric breakdown and size - of particles having enveloping membrane by passage through measuring aperture in electrode cell

KERNFORSCHUNGS JULICH 28.06.78-DT-828232

B04 R11 R16 (09.01.80) G01b-07/04 G01n-27/07

A process for determining the dielectric breakdown of particles having an enveloping membrane involves suspending the particles in an electrolyte. The particles are introduced to a measuring aperture through which the electrolyte flows and through which extend lines of electric force generated by a voltage applied to electrodes positioned on opposite sides of the aperture. The particles are exposed as they pass through the aperture to a linearly increasing electric field.

It is arranged that dielectric breakdown of the individual particles occurs as it passes through the aperture. The breakdown is determined by determining the field strength at which the rise of current through the aperture deviates from linearity. The particle size before and after breakdown is determined by measuring the extent to which the current through the aperture deviates from an expected current.

Used for determining the dielectric breakdown of particles which have an enveloping membrane such as biological cells, liposomes, protoplasts, chloroplasts or vacuoles. It may be used in the investigation of the effect of pharmaceuticals or poisons in concentrations which cannot be tolerated by biological cells, or for the examination of the influence of diseases on the condition of living cells. 27.6.79 as 022305(12pp295).

Enterobacteria type determination - using thermal differentiation analysis after specified culturing test strain

IVANOVO MEDICINE IN 21.10.77-SU-535931
(26.04.79) C12k-01

Differentiation between enterobacteria is carried out by cultivating the bacteria in a nutrient medium, and then determining their proliferation.

The method is rendered more accurate by washing the culture (in an agar medium), drying, disintegrating and performing differential thermal analysis (DTA) to determine the genus and form of the enterobacteria.

The enterobacteria are cultivated in a nutrient agar medium for 1 day. Then the culture is washed with a twice distilled water; dried at 60°C, and ground for 5 min. The subsequent DTA takes 60 min. The characteristic peaks are ($\pm 1-2^\circ\text{C}$) salmonella 242 and 300°C; Shigella 242, 275 and 316°C; Escherichia 300 and 316°C; Proteus vulgaris 305, 325 and 340°C; Proteus mirabilis 305 and 325°C, Proteus morganii 305°C.

Cultivation of hemicellulase-producing strain of fungus *Aspergillus* using aq. nutrient medium contg. extract of wheat bran in sebatic acid soln., extract of malt germs and sodium nitrate

BIOTECH RES INST 17.10.77-SU-534774
(26.04.79) C12d-13/10 C12k-01/06

Nutrient medium for deep cultivation of the hemicellulose producing fungus *Aspergillus awamori* 16 contains extract of wheat bran and malt germs and NaNO_3 . This medium is prepd. by carrying out a first extraction of wheat bran with an acid soln. at elevated temp; and carrying out a second extraction with the first extract in an autoclave. This method is improved by carrying out the extraction of the wheat bran with a sebatic acid soln. (pref. concn. 0.04-0.2%), whereby the activity of the hemicellulose is increased by 50%. The duration of the two extraction stages is 1.5-2.0h. and 1-1.5h. respectively.

The compsn. contains (in wt. % w.r.t. the total compsn.) 6% extract of wheat bran in 0.05-2% sebatic acid soln. 88.73, 10% extract of malt germs 10.0, NaNO_3 0.27. No ppt. is formed during the sterilisation.

Extending storage viability of microorganisms in dried cultures includes growing microorganisms on polyacrylamide gel plate impregnate with nutrient medium and drying at specified temp.

KIEV MEDICINE INST 03.08.77-SU-515472
(26.04.79) C12k-01/08

The storage viability of microorganisms in dried culture is extended by growing the microorganisms on polyacrylamide gel plates imbued with a nutrient medium; then cutting out of the plate cylindrical bodies (dia. 1.0-1.2 cm) and drying them at 37°C.

The preparation is stored at 4°C.

The biochemical properties of the microorganisms are preserved. They are able of propagating upon reamination.

The method is much simpler than the customary lyophilic drying of the microorganism cultures. In an example, staphylococcus aureus is stored by this method.

Inactivation of virus of infective bronchitis of chicken - by repeated culturing in chick embryo and use of aq. soln. of ethyl-mercury-thiosalicylic acid

MOSC VET ACAD SKRYA 22.03.77-SU-465500
B04 C03 (26.04.79) C12k-07

Virus of the infective bronchitis of chicken can be inactivated by treatment with ethylmercurythiosalicylic acid (m.pt. 111°C) after passivation by culturing in chick embryo. There is no need to apply any additional chemical treatment. The $\text{LD}_{50} = 75 \text{ mg/kg}$. (w.r.t. rats).

A soln. of ethylmercurythiosalicylic acid is prepd. by dissolving 100 mg. of this cpd. in 10 ml. of the nutrient medium 199 at 370°C for 3h. Then the soln. is used for inactivation of the bronchitis virus extracted from 9-day old chicken embryos, at 37°C for 3 days.

 determining foaming tendency of liquids - by bubbling air at
 different velocities and comparing with foaming of reference
 liquid, used in microbiology etc.
 SIDOROV V M 11.11.75-SU-192422
 216 (30.04.79) B01d-19/02 C12b-01/18 G01n-33
 foaming tendency of liquids can be determined by bubbling
 through a liquid contained in a measuring cylinder
 until the foam level reaches a constant value. This
 method is improved by gradually increasing the velocity
 of the air stream from 0.01 m/sec. to a critical velocity
 at which the foam layer disappears.
 The index of the foaming tendency is the ratio of the
 volume of the liquid introduced into the cylinder to the
 volume of a reference liquid corresponding to the same
 critical velocity as that of the liquid under test. By this
 method the foaming tendency of any liquid can be deter-
 mined with good accuracy.
 This method is esp. suitable for use in the microbio-
 logical industry for the determin. of the foaming tendency
 in culture media.

Prodn. of a sugar alcohol (I) comprises selective hydrogenation of a keto sugar (II) soln. in a pressurized system contg. H₂ at $\geq 80^{\circ}\text{C}$ using as catalyst finely-divided metallic Cu on a (pref. insol.) particulate support. The majority of metal particles have max. dimension < 60 (pref. < 35) nm.

Pref. the soln. has pH > 7 and the system may contain (a) oxyacids or oxyanions of B and/or (b) an O-free inorganic anion, esp. Cl, Br or I.

Reaction is stereoselective with predominant prodn. of only one possible stereoisomer. Reaction can be carried out at high temp. without degradation.

The process is esp. used for converting fructose to mannitol or invert sugar to mannitol and sorbitol, with $> 50\%$ conversion of fructose to mannitol in both cases. 25.5.79 as 300949 (29pp1251).

Level control for syrup tank in sugar prodn. - has sampler pneumatically switched to positive and negative chambers of differential manometer, with output to control contg. counters

SAKHPROMENERONALADK 21.06.77-SU-498873

R26 (18.04.79) C13f-01/14 G05d-09/12

Known level control for tanked syrup in sugar prodn. contains a hydrostatic sampler, differential monomer and pumps. For greater accuracy of level determination, the sampler is switched to positive and negative chambers of a differential manometer with output to a control contg. electric counters. As the syrup rises to e.g. one-tenth, the hydrostatic pressure is proportional to the level. This is converted into electric pulses for a count to control pumping.

Determining concn. of sugar solns. in sugar industry - based on electroconductivity changes during dilution of conc. soln.

MOSC FOOD IND TECHN 11.10.74-SU-066254

R16 (25.04.79) G01n-15/06 G01n-27/06

Concentration of sugar solns. can be determined by measuring their electroconductivity.

The method is rendered more accurate by diluting the sugar soln. until extreme value of the electroconductivity is attained, and then calculating the starting concn. from the ratio of the electroconductivity values before and after the dilution, using a calibrated curve.

This method is used for measuring the concn. of sugar juices in sugar factories. In an example, the syrup leaving the evaporator (concn. 70%) has an electroconductivity of $0.00332 \Omega^{-1}$. The extreme electroconductivity is $0.0401 \Omega^{-1}$ at concn. 29%. The accuracy of the method is 1-2% w.r.t. the solids. This permits a more accurate calculation of the optimal process parameters.

Vegetable material acid hydrolyser - has a cylindro-conical tank with coaxial digesting and washing fluid pipes, useful in cellulose etc. mfr.

IPPOLITOV YU S 28.03.77-SU-481856

(30.04.79) C13k-01/02

The efficiency of acid hydrolyser is enhanced by optimising the density of the vegetable raw material in the zone of discharge and ensuring a uniform feed rate and distribution of the digesting and washing fluids. The tank comprises cylindrical and conical sections with a height ratio

of 1:3, and coaxial pipes along its geometrical axis carry the fluids for digestion and washing.

The discharge is controlled by tubes having ejector-type intakes in the discharge zone of the material while the shut-off valves are fitted outside. Each intake comprises a coaxial cylindrical shell with a conical bottom narrowing down below a conical part which expands downwards above it, and bounds the annular slot.

Grinding material prodn. for use in dentistry - by embedding hard particles with soft coating in binder such as polyester or PTFE

IDENTOFLEX AG 16.05.78-JA-057231

A96 E37 L02 P61 (27.11.79) B24d-03/28

Grinding material is produced by embedding grinding particles such as silicon carbide particles or aluminium oxide particles in a plastic binder having anti-abrasive nature and high tearing strength such as polyester or polytetrafluoroethylene. Before the embedding step the grinding particles are coated with a soft film more mild than the film of the plastic binder. The grinding material has a good elasticity and it is used for dental therapeutical purposes. 16.5.78 as 057231 (2pp15)

Wound-healing compsn. applied topically - obtd. by fractionating alcohol extract of aloe arborescens mill var. natalensis
LION DENTIFRICE KK 13.05.78-JA-056995
B04 (28.11.79) A61k-35/78

Novel compsn. having wound-curing action is fractionated from an ethanol extract of Aloe arborescens mill var. natalensis (or related plants). The Rf value of the fraction in thin layer chromatography is 0.10-0.38 developing solvent ethyl acetate: methanol: water = 20:3:2 (vol. ratio), plate is silica gel). The fraction is odourless has thin brown colour and does not contain any aloin, Aloe emodin or polysaccharide.

The fraction is applied externally to wounds, cracks in the skin, chaps and burns. It can be used to treat piles and in cosmetics such as after-shave cream, medicinal cream, lotion or hair cosmetics. LD₅₀ by oral admin. to a rat is > 5000 mg/kg, and no irritation to the skin is found. The fraction has high solubility in water or water-ethanol is high and it can be readily formulated into an ointment or lotion. 13.5.78 as 056995 (5pp69)

Bonding dental bracket to tooth - using alpha-cyanoacrylate adhesive absorbed in filler in open-scrim envelope
WHITE V C 06.09.77-US-830425
A96 P32 P73 (A14) (25.12.79) A61c-07 B32b-31

An orthodontic device is bonded temporarily or permanently to a tooth by interposing an open-scrim envelope contg. finely divided filler material between the device and the tooth, infusing an alphacyanoacrylate resin through the filler, which lengthens the curing time of the resin, and pressing the device against the tooth and retaining it in place until the resin has cured.

The method is esp. useful for fixing braces. It avoids the need for placing a band around the tooth. The bonding agent is non-toxic, the bond is strong and does not weaken or creep, and the device can easily be removed when this is desired. The method is designed to leave little scope for careless or faulty application. 6.9.77 as 830425(4pp)

Deodorising footwear insole - having top fabric, bottom compressible plastics layer and intermediate deodorant particle contg. incompressible plastics layer (BR 22.5.79)

SCHOLL CANADA INC 02.11.77-US-847918

A83 F08 P22 P73 (18.12.79) A43b-07 A43b-13/40 A43b-17 B32b-05/22

A footwear insole comprises a laminate composed of a bottom open cell resilient compressible plastics sheet with a smooth bottom skin; an intermediate pliable relatively incompressible plastics sheet in which odour-absorbing chemical particles are uniformly dispersed and locked; and a top fabric sheet with a slippery abrasion-resistant top surface.

The layers are bonded together and holes extend through them, exposing the particles in the intermediate layer. The holes are sufficiently large so as not to be closed during compression of the bottom layer by the foot load. The particles are pref. activated charcoal (~200 mesh) and the intermediate layer is pref. of styrene-butadiene latex.

When the bottom layer is compressed, air is pumped from the cells through the holes into intimate contact with the chemical particles, so that odours and moisture are absorbed. The footwear and wearer are protected against staining resulting from migration of the particles.

A composite non-woven fabric (1), comprises at least two plies (2,3) of hydrophobic microfine fibres of diameter ≤ 10 µ and a cover ply (4), the plies being bonded together around their periphery. The microfine fibre plies have a basis wt. ≥ 10 g/m² and a density of 0.15 g/cc.

The microfine fibre plies may be of melt blown nylon, polyester or polypropylene fibres and the cover ply may be an apertured plastics film or a spunbonded or wet or dry laid web of discontinuous fibres of rayon, polyester, polypropylene or nylon, the fibres having a diameter ≤ 40 µ, a length ≤ 10 mm and the web having a basis weight ≤ 34 g/m². There may be up to five microfine fibre plies. A fibrous strength imparting ply may be incorporated.

The fabric has an air permeability ≥ 150 mm³/s m², a liquid column strike through resistance ≥ 250 mm, a bacteria strike through resistance ≥ 20 kN/m² and a density ≤ 0.1 g/cc. All these characteristics render the fabric of special use in surgical items such as surgical gowns, and surgical drapes.

Germicidal iodophor powder prodn. - by reacting undissolved organic cpd., esp. polyvinyl pyrrolidine, with solns. of iodine and iodide

MUNDIPHARMA AG 12.06.78-US-914683

A96 (09.01.80) A01n-59/12 A61k-33/18

D/S: E(BE, CH, DT, FR, GB, IT, LU, NL, OE, SW).

Prod. of an iodophor powder (A) comprises suspending an organic iodophor-forming cpd. (I) in a soln. of iodine, dissolved in a solvent in which (I) is not soluble, then adding an iodide dissolved in a solvent system miscible with the iodine solvent. Pref. the iodide soln. is added until the iodine soln. becomes colourless.

(I) is esp. polyvinylpyrrolidone; the iodine solvent is esp. a satd. or halogenated alkane and the iodide solvent esp. a mixt. of water and aliphatic alcohol or ketone. Pref. iodides are HI, NH₄I, LiI, NaI or KI.

(A) are germicides.

Since a solid (I) is used subsequent spray-drying etc. is avoided. Iodine vapours are not evolved during the process and the iodine solvent can be recycled after washing.

Foamed plastic cover for neurosurgical operation - comprising sheet of open celled hydrophilic polymer

FUJI SYSTEMS CORP 05.07.78-EP-100309

A96 P32 P34 (09.01.80) A61f-13 A61l-15

D/S: E(DT, FR, GB, SW).

A cover for placing on the brain or spinal cord during a neurosurgical operation comprises a sheet of open-celled hydrophilic polymeric material. The material must be water insoluble, pliable, chemical resistant. The sheet has thickness 0.5-3 mm, a porosity 85-95% and a water holding capacity of 8-19 times the dry wt. of the sheet.

Pref. materials for the sheet are polyvinylformal or viscose.

The cover remains wet for an extended length of time, does not leave material on the underlying tissue or pull the tissue upon removal and is non reactive to the ambient chemicals.

D/S: E(BE, CH, FR, GB, IT, LU, NL, OE, SW).

Implantable synthetic bone material consists of particles of bio-active sintered Ca phosphate ceramic with CaO: P₂O₅ between 3 : 1 and 4 : 1 supported in a matrix of material. The material consists of a massive core of tissue compatible metal with a layer of Ca phosphate particles 500µm to several mm. long forming the contact surface with body tissues. The material may be made by casting or hot pressing processes. Sintered bodies can be made from mixts. of metal powder and Ca phosphate.

The prosthesis forms a strong bond with the bone which is not subject to stress loosening. The implants have high chemical stability.

Protective pad for menstrual and pathological flow - has contour conforming better to feminine anatomy with vulvar tampon

BEGHIN-SAY 20.03.78-FR-007934

P32 (23.11.79) A61f-13/16

A protective pad for feminine hygiene is absorbent and only of slight thickness. It is roughly oblong and has front and rear parts which are rounded. Close to its longitudinal axis it has a protuberance of absorbent material. This is inserted completely between the outer lips of the vulva without penetrating inside the vagina.

In the central zone of this protuberance which contains a small quantity of super-absorbent components, there is a recess for the collection of the debris of the mucous membrane.

The pad is moulded from a suspension of fibres in air with a peripheral bead. It presents the form which is best adapted to the feminine anatomy and considerably reduces the possibility of lateral leakage. 20.3.78 as 007934 (11pp)

Hydroscopic filament or fibre of a fibre-forming synthetic polymer, has a water permeable sheath and a micro-porous core. Both the sheath and core contain voids. The voids in the core forming an interconnected system open to liquids through voids in the sheath.

The average size of the voids in the core is $>100000\text{\AA}$ and is larger than the size of the voids in the sheath. The filaments or fibre has a water retention capacity $\geq 10\%$, of porosity of $\geq 10\%$, and a fibre swellability of $\leq 10\%$ which is lower than the water retention capacity.

The wearing comfort of textile produced from the fibres is improved. Pref. the fibres are of acrylonitrile polymer.

Ethoxylated alcohol mfr. - by reaction of alcohol with ethylene oxide using barium-contg. catalyst
CONTINENTAL OIL CO 16.06.78-US-916421
A25 E17 (09.01.80) B01j-23/02 C07c-41/02
D/S: E(BE, DT, FR, GB, SW).

Alcohols are contacted with ethylene oxide in the presence of a catalyst chosen from (hydrated) barium hydroxide, barium oxide and barium metal at 200-500°F to form ethoxylated alcohols.

The process is used to form products for use as detergents and cleaning agents, domestic and industrial laundry detergents, detergent builders, polishes, sanitisers and dry cleaning materials. They can also be used in the pulp and paper industry and in the fibre industry.

By use of the specific catalyst, the process provides a narrow distribution at high mole ethylene oxide adducts while yielding a very low level of free alcohols and undesirable by-products.

ALERTING PATENTEE INDEX (III)

Weekly by section and overall, lists all current patents in patentee code order and, within a given patentee, in earliest priority date order. The first line gives patentee code, earliest priority date, patentee name, CPI classes and finally the current patent number. The second line gives the first part of the title, followed by the accession number.

CPI CLASS INDEX (IV)

Weekly only. Headings are all the CPI classes within the section to which an Alerting Bulletin relates, arranged in numerical order. Posted under each class heading is a list, in country then patent number order, of all basic or equivalent documents referenced or cross-referenced under that heading.

In Country Alerting Bulletin only

BASIC NUMBER INDEX (V)

Weekly by section and overall, lists all entries by accession number. Each heading consists of the accession number in bold, followed by the CPI section letters. There then follows a list of all the family members, commencing with the basic and finishing with the current week's patent. For each family member the CPI week of issue is quoted, and a plus sign indicates that a multiple priority has been claimed.

PATENT NUMBER INDEX (VII)

Weekly by section and overall. Lists left to right the patent type (* for basic, = for equivalent or # sign for non-convention equivalent or where the priority has been artificially "added" to the specification), patent number, accession number and CPI classes.

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A-M cumulations of from a quarter up to 5 years are available as COM.

MANUAL CODE INDEX

IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180
Europe	150
France	740
Germany, W. unexamined	1050
Japan unexamined	845*
Netherlands unexamined	240

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

Q76 + Q75 (D12) (10.01.80) *NL7300-451 A21c-15 A23p-01

Freshly baked bread or pastry cases are cooled in a vacuum chamber to evaporate the moisture and reduce the temp. The evacuation process, represented by a curve of pressure versus time, is controlled by reducing the flow resistance in the pump circuit so that it differs from the normal hyperbolic shape. The actual optimum shape of the curve depends on the type of pastry and is adjusted so that on the one hand the pastry does not crumble away and, on the other hand, does not lose too much moisture from the outside.

This eliminates the damage done to the baked prods. by uncontrolled evacuation. 15.1.73 as 301807
(+20.4.72-GB-018265)(13pp39)

WEISERT- ★ D11 03676C/03 ★ DT 2827-522
Dough rolling machine control - by program cam discs for gradual roll gap reduction plus final gap control disc
WEISERT LOSER & SOH 23.06.78-DT-827522
(10.01.80) A21c-03/02

A dough rolling machine with reversible feed belts and reversible rolls has a control for the successive reduction of the roll gap, based on cam discs on a control shaft. Three program control discs can be turned through a limited angle relative to the disc for the control of the gap extremes; they are separated from it by a friction clutch with a greater holding force than the friction clutch driving the control disc of the final gap.

The final roll gap and the thickness of the rolled-out dough band can thus be selected independent of the position of the program. 23.6.78 as 827522 (13pp39)

SWIL D11 91700A/51 = US 4181-213
Biscuit counting stacker - with biscuits transferred from inclined pockets of endless conveyor by rod pairs on second conveyor (NL 85.12.78)

SIG SCHWEIZERISCHE 02.06.77-CH-006812
Q31 Q36 + Q35 (01.01.80) *DT2823-690 B65g-57 + B65g-47/26

Stacks of flat articles, e.g. cookies, are formed by conveying the items in successive pockets along a conveying

path and moving vertical rod assemblies parallel to the path but at a different speed from the pockets to cause the rods to engage items in each pocket and push them onto items in an adjacent pocket. Each rod assembly forms a stack of progressively increasing height as the pockets and rod assemblies travel along a common path.

Increased operating speeds are obtd. 1.6.78 as 911308 (7pp976).

SHIN/ ★ D11 05139C/03 ★ US 4181-746
Prepn. of steam-kneaded vermicelli prods. - by kneading with water and compressed steam under controlled conditions
SHIN SH 30.10.76-JA-130712
(01.01.80) A23l-01/16

Vermicelli (I) prods. are prepd. by (a) placing (I) material and H₂O (35-40 pts/100 pts. (I)) at 36-60°C in a kneading vessel; (b) adding steam (at 0.6-2.5kg/cm²) to the vessel at the same as or just after the H₂O to steam-knead the contents; (c) heating (I) to 50°C within 15-60 sec. by the steam; (d) continuing the steam-kneading until the (I) temp. reaches 90-100°C and (e) recovering a semi-transparent yellowish-white (I) paste with high viscoelasticity.

Extremely rapid, efficient process afford (I) pastes of excellent appearance, texture, eating feel, digestibility, processability and boiling time. In addn., the prepd. (I) pastes are stable to prolonged storage. (I) pastes may be processed to a variety of materials. 22.9.77 as 835770 (14pp478).

ACEC- D11 86869Y/49 = US 4182-230
Macaroni frying method - using containers on endless chain with telescopic spill frame depressed during frying by perforated overhead conveyor lids
ACECOOK CO LTD 19.05.76-JA-058224
+ P28 (08.01.80) *DT2720-584 A23l-01/16 A47j-37

Noodle-frying apparatus includes a heated oil tank and liquid-permeable frying vessels with open frames slidably fitted to the vessel peripheries to telescope over without detachment. Each frame is spring-biased so that it extends above the vessel top to temporarily enlarge the inner volume.

Caps each engage the open end of a frame face-to-face. A conveyor carrying the vessels and frames periodically positions them within the tank, and a second conveyor moves the caps into the tank synchronously with the vessels. The conveyors progressively converge within the tank so that the caps increase the force to push the frames down and reduce vessel volume so that the noodles are formed into a lump of uniform density and given shape. 9.5.77 as 795222 (5pp1358)

Appts. for rendering and dehydrating animal by-products - in which processing stream speed is controlled by temp. sensors
TEXAS RENDERING CO 23.12.76-US-753642 (12.01.76-US-648195)
Q76 (25.12.79) A23l-03 F26b-17

Appts. includes a device feeding the raw materials continuously through a closed flow path. The feed speed through the path may be varied as a function of the temp. of the material as it passes ≥ 2 predetermined flow positions. The materials are heated as they pass along the path to a progressively higher temp. sufficient to drive off water. The path is divided into sub-paths and the feed speed to each subpath is separately controlled. The discharged materials are recovered.

Appts. is used to render animal and poultry by-products to obtain dehydrated meal and grease. It is fully automated to accommodate large changes of raw material moisture content. 12.1.77 as 269567 (16pp295)

POLA= D12 49984A/28 =DS 2700-068
Fish filleting machine - has pairs of disc cutters with automatic adjustment of cutter gap by threaded hubs and torsion spring
POLAR MARINE FISH 03.01.77-DT-700068
(10.01.80) *DT2700-068 A22c-25/16

A fish filleting machine uses a pair of circular cutter blades which are coupled to each other by a dog clutch and are automatically adjusted axially on the drive spindle to suit the thickness of the fish backbone. The hubs of both cutter discs are joined to the drive spindle by threads of opposite hand. A torsion spring inside a bush, keyed to the drive spindle, responds to the greater cutting torque required when contacting the backbone and allows the gap between the cutter discs to be increased until just soft meat is cut.

The result is a very high efficiency in filleting fish by minimising waste even though the sizes of fish may vary. 3.1.77 as 700068 (7pp39)

MUDD/★ D12 03660C/03 ★DT 2827-158
Sausage skin hose clamp - with hinged halves and eccentric cam on hand lever
MUDDER H 21.06.78-DT-827158
(10.01.80) A22c-11/12

Sausage skin hoses, made up of a material such as nylon tube, lose their stability if handled without a tubular core on which the hose is gathered in close corrugations. Their transfer to the filler spout requires manual handling and loses productive machine time. This can be saved if the hose is pushed complete with tubular core over the filler spout and is held at the machine end by a split clamp with a hinge at one end and an eccentric cam with operating lever at the other end.

Such a clamp can be readily made by any user to save valuable time. 21.6.78 as 827158 (4pp39)

VOGT ★ D12 03749C/03 ★DT 2829-882
Carcass skinning device - with rope on ring and chain to release skin from loop on completion of flaying
VOGT KG 07.07.78-DT-829882
(10.01.80) A22b-05/16

A skinning device for animal carcasses in abattoirs consists of a drum on which the hide is wound up. A chain with a ring is attached to the inner side wall of the drum to form a loop. A length of rope is fixed from a diametrically opposed point of the side wall to the junction of chain and ring.

The rope automatically releases the loop in which an end of the skin was trapped for the skinning process, after the drum has been reversed to unwrap the skin. No manual labour is now required for this operation. 7.7.78 as 829882 (9pp39)

KORH/★ D12 03796C/03 ★DT 2925-325
Meat holding tool for carving operations - with grip plate hydraulically moved towards hook plate
KORHONEN K J 22.06.78-SW-007190
(10.01.80) A22c-17/02

Tool for holding meat during carving operations off animal rumps in abattoirs consists of a handle with a protruding interchangeable hook and a hydraulic cylinder which can move a piston rod with a grip plate towards the hook. The hook can have a serrated edge or a knife edge.

Arrangement simplifies the steady holding of meat during the carving operation without causing damage to the meat. The cut-off portion can be pulled off mechanically and saves heavy manual labour. The risk of injuries to the steadying hand of the carver is eliminated. 22.6.79 as 925325 (14pp)

FARH ★ D12 03834C/03 ★EP ---6-601
Continuous mfr. of fibre-reinforced, cellulose hydrate-based hose - by treating it during its downward movement internally and externally with precipitating liquids
HOECHST AG (KALL) 03.07.78-DT-829102
A11 (A35 A97) (09.01.80) A22c-13 B29d-23/06
D/S: E(BE, DT, FR, GB).

Fibre reinforced hose based on cellulose hydrate is mfd. continuously by feeding it downwardly at a constant speed, treating it along its outer wall at at least peripheral zone with a precipitating liquid, exposing it to air,

washing and treating it with an aq. soln. containing a plasticising agent. Hose is then dried and opt. wetted with water.

Used for sausage skins mfr.

Rate of mfr. is increased whilst sulphur disulphide and hydrogen sulphide are eliminated. Also hose can be guided in a simple manner during the coagulation stage and cutting of the hose at frequent intervals for the purpose of venting of gases and removal of unwanted liquids from hose interior is dispensed with.

25.6.79. as 102094 (31pp536).

(G) ISR: FR 2013806; DS 1504982; DS 1107928;

GETP-★ D12 03948C/03 ★FR 2420-926
Food moulding machine partic. for beefburger etc. - presses mince directly into preformed packaging tray to avoid handling prod.

GETPLAST REP 31.03.78-FR-010313

(30.11.79) A22c-07 A23I-01

The machine is of the type in which a mould plate reciprocates in a plane beneath and at right angles to the axis of the outlet of a mincing machine. The plate dwells alternately in two extreme posns., i.e., a filling posn. with the mould cavity directly under the mincer outlet and a demoulding posn. for cake removal.

The empty mould cavity is now lined with a corresp. preformed tray of packaging material. At the filling posn. the mincer injects material into the tray to form a prod. which is then demoulded complete in tray. Prior to demoulding, the mould plate pref. locates the filled tray under a closing head where a cover is heat-sealed on to the tray so that the prod. is completely enclosed.

The mould plate, filling head and plate guides are pref. made of food quality plastic partic. polythene. 31.3.78 as 010313 (13pp448)

BECK- D12 48842Y/28 =GB 1559-215
Packaging food portion with liq. in plastic dish - esp. sausages in brine with air excluded before sealing cover film
NATURIN WERK BECKER 11.03.76-DT-610083
A97 Q31 (16.01.80) *BE-852-365 B65b-03

Foods contg. liq. are packaged by placing a flexible cover over the food when placed in a horizontal container so that only limited gap is left between an edge of the container and the cover, moving the container into a vertical position until the gap upwards, pressing the cover so that the liq. rises towards the gap to displace gas, and, when the liq. is sensed at the gap, sealing the gap.

Container is pref. vibrating to facilitate the removal of the gas. A diaphragm is pref. used to press the cover. Foods contg. pickles, sauces, or liq. preservatives can be packaged. 10.3.77 as 010189 (6pp1376)

UENS ★ D12 04476C/03 ★J5 4154-560
Frozen minced fish prepn. - by mixing the fish with hydrophilic solid colloid contg. sorbitol and surfactant poly:phosphate and opt. sugar before freezing

UENO SEIYAKU OYO KE 22.05.78-JA-059967

(05.12.79) A23b-04/06 A23I-01/32

The method comprises combining (a) 1-7 wt. % powdery hydrophilic solid colloid which is composed of 85-98 wt. % sorbitol and 15-20 wt. % of surfactant of food additive use and/or edible oil and has the particle size 16 mesh, (b) 0.1-0.4 w/w% of polyphosphate and opt. (c) 1-7 wt. % sugar in minced fish. Frozen minced fish of excellent preservative property, whiteness and elasticity can be obtd.

The hydrophilic solid colloid can be prepd. by (a) dissolving the surfactant and edible oil in heat-melted sorbitol, (b) adding sorbitol as the seed crystal, (c) crystallising the mixture to the solid colloid, (d) drying the colloid and (e) crushing.

As the surfactant glycerin fatty acid ester, propylene-glycol fatty acid ester, sorbitan fatty acid ester, sucrose fatty acid ester, polyoxyethylene sorbitan fatty acid ester and lecithin can be used. 22.5.78. as 049967 (11pp5)

NORD/ ★ D12 04556C/03 ★ NL 7904-841
Mechanical application of classification stamp to slaughtered carcass - where stamp and support are mounted on pistons to hold and stamp carcass legs automatically
NORDFLEISCH AG 21.06.78-DT-U18590
P75 (28.12.79) A22c-17/10 B41k-03

Classification marks are applied to the hind legs of slaughtered animals, partic. pigs, by means of stamps mounted on a guide rail system which permits the stamps to move in a horizontal plane and supports which come into contact with the back of each leg as the stamp is applied. The stamps and supports are moved in a direction perpendicular to the guide rails pref. by means of hydraulic or pneumatic cylinders, the stamps and supports being mounted on the ends of the piston rods.

The support is in the form of a fork to ensure that the leg is held securely during the stamping action. The pig is usually suspended by the front legs and opened out in two halves. In this case, the stamp and supports are arranged in pairs so that both legs of a single pig are stamped simultaneously. A dye pad, also actuated by a cylinder, swings over the stamp when it is withdrawn.

The device eliminates the manual application of classification marks to the legs of the animal in the slaughterhouse. 20.6.79 as 004841 (7pp1370)

CHUB/ ★ D12 04728C/03 ★ SU -660-650
Cleaning, degreasing and cutting of poultry stomachs - using sectional equipment with disc knife, fluted feeding rollers, troughs and screw conveyor
CHUBATYUK I F 15.06.77-SU-498008
(11.05.79) A22c-21/06

Device for the sanitary processing of the stomachs of poultry, comprises disc knives, attachment for withdrawing the cut stomachs, and a cleaning mechanism. Processing quality and productivity are increased, by including a degreasing mechanism located in front of the disc knife, with two symmetrically-positioned horizontal, driven, fluted rollers. These are placed above the disc knife in such a way that its cutting edge is located below the horizontal axis of symmetry of the rollers.

The degreasing mechanism is connected to the fluted rollers by means of a trough and a screw. The degreasing and cleaning mechanisms are made in the form of a vertical stationary cylinder with rotating bottom, the internal surface of which has a carborundum coating.

Chubatyuk, I. F., Medvedev, A. D. Bul. 17/5.5.79.
15.6.77 as 498008 (2pp29)

Animal feed prodn. from meat processing waste - includes boiling fragmented bones etc. sepn. evapn., addn. of bone fat, antioxidant and mineral salts
MOSC VETERINARY ACA (MOGE=) 22.07.77-SU-510350
C03 (11.05.79) A23k-01/10

Feed produced from waste animal materials, esp. wastes from the processing of collagen-contg. materials (gelatin prodn.), contains bone fat stabilised with an antioxidant, and proteinaceous and mineral components.

This compsn. is improved by using as a protein source a dry concentrate of the broth obtained by cooking bones and, as a minerals source, a ppte. formed by neutralisation of maceration lyes obtained by decalcification of the bone material. By this method, the nutritive value of the feed is increased by enrichment in proteins and improvement of the minerals content.

The compsn. contains (in wt.%) evapd. broth from bone cooking 60-86.4, precipitate (as described above), bone fat (contg. 0.015-0.020% of santoxin antioxidant) 3.3-9.1. The ppte. contains mainly CaHPO_4 . The feed may contain 5% of fish flour.

Isaeva, I. A., Kasparyan, S. A., Arkhipov, A. V. et al.

A mould has integral plastic flat top and sidewalls defin-

ing a cavity. The walls are notched at two points on opposite sides, and the top has a U-shaped slot with its ends on a line between the points. The top is of reduced thickness between the slot ends and notches to form hinges.

The mould is pref. circular in plan and the notches are at diametrically opposed points, the slot extending almost to the walls. Thickness is pref. reduced by grooves formed in the underside. There may be a lateral tab at a point adjacent the slot. The mould is e.g. of polypropylene and the hinges facilitate removal from a pressed patty.

Patty moulding in reciprocating plate - loaded by plunger with fast retraction cycle to minimise food working
FORMAX INC 28.02.78-US-882121
(08.01.80) A22c-07

A hopper holds food which is transferred to the cavity in a reciprocating plate. The mould plate is then moved to a discharge position where the patty is removed by an ejector. A plunger receives food from a feed auger in the base of the hopper and transfers this to the mould in a synchronised sequence. The plunger is driven by a double-acting ram to provide fast retraction and slow delivery strokes.

The auger is only activated while the plunger is being

retracted although the dominant effect is the suction caused by the fast retraction. Pref. the entire appts. is driven from a single hydraulic pump.

The appts. forms food patties. The fast retraction of the plunger draws food without excessive working. 28.2.78 as 882121 (11pp295)

The method comprises (a) adding ≥ 1 of hydrophilic wax, oil and fat, fatty acid, natural resin, etc., of which ≥ 1 has crystallising property, to an organic solvent, in which L-ascorbic acid or its salt shows low solubility and the hydrophilic substance shows high solubility, so that its concentration is 5-50 w/w%. (b) dissolving the hydrophilic substance with heating, (c) adding L-ascorbic acid or its salt to the solution, (d) keeping the suspension for 0.5-24 hours at the optimum crystallising temperature of the hydrophilic substance for crystallising out the hydrophilic substance including L-ascorbic acid or its salt as the nucleus and (e) removing the organic solvent. The fine powder is so prepared that L-ascorbic acid or its salt is included 1-80 w/w% in the fine powder. As organic solvent hydrocarbon, ketone, halohydrocarbon, etc. having b. pt. $< 100^\circ\text{C}$ can be used. 23.5.78. as 060618(5pp)

Fried foods prepn. - immersing the food in aq. soln. of wetting agent prior to frying

Q.P. CORP 26.05.78-JA-063111

(05.12.79) A21d-13/08 A23I-01

The fried foods can be prepd. by immersing food material of desired form in aq. soln. of wetting agent and frying as usual. Fried foods (e.g. sausage, meat, apple pie or corn) without coating are excellently glossy and non-sticky.

As wetting agent dextrin, malbitol, propyleneglycol, corn syrup or sorbitol can be used. The melting agent is used in aq. soln. having concn. 20-60 w/w%. The immersion is practised for 5-60 minutes. 26.5.78. as 063111 (3pp5)

TSU-★ D13 04474C/03 ★J5 4154-554
Dry vegetable or fruit juice compsn. - is prepd. by adding glucose oxidase to dry foodstuff contg. pulpy substance
OTSUKA EIYO KENKYUS 26.05.78-JA-063465
(D16) (05.12.79) A231-01/21 A231-02/26
The compsn. can be easily restored to natural vegetable or fruit juice by resuspension in water. The suspension is stable for long periods. Addn. of glucoseoxidase prevents the pulpy substance from being sepd. and floating out. Thus uniform suspension, similar to the natural juice is obtd.

The dry food compsn. can be prepd. from vegetables such as spinach, radishes, cabbage, carrots, lettuce, celery, parsley, burdock, egg-plants, cucumbers, etc. and fruits such as oranges, lemons, grapefruit, apples, peaches, plums, grapes, pineapples, etc. Glucoseoxidase can be obtd. from moulds, such as *Aspergillus niger*, *A. oryzae*, *Penicillium glaucum*, etc. 26.5.78. as 063465 (5pp5)

Processing wakame seaweed - by treating with weakly alkaline aq. soln. contg. sodium phosphate and acetic acid, to provide dried prod.

FUJINAKA Y 24.05.78-JA-061116
(05.12.79) A231-01/33
The method is effected by treating 'wakame' seaweed with the aq. weakly alkaline soln. which contains sodium phosphate and acetic acid and shows buffering activity. Dry 'wakame' which can be easily restored to 'wakame' having required rigidity, good colour and desirable texture as natural 'wakame' can be obtd.

By treating 'wakame' with aq. weakly alkaline soln. Defects of prior art can be avoided. Aq. buffer soln. which contains sodium phosphate 0.1-5% pref. 0.5-3% and acetic acid 0.01-0.5% pref. 0.05-0.3% and has pH 7.5-9.5 pref. 8-9, can be used. 24.5.78. as 061116(3pp)

LOTT★ D13 04477C/03 ★J5 4154-569
Chewing gum for sportsman - contg. increased glucose and sodium chloride content with citric acid, potassium salt and vitamin(s)
LOTTE KK 20.05.78-JA-059510
(05.12.79) A23g-03/30 A61k-09/68

Chewing gum of sportsman use is prepd. by mixing 5-80 wt. % glucose, (b) 0.5-10 wt. % organic acid, (c) 0.01-2 wt. % potassium salt and 0.01-2 wt. % sodium chloride and opt. vitamins, bitters.

The chewing gum contains 5-10 times more glucose than the conventional chewing gum of high energy source, large amt. of sodium chloride for supplementing that lost in sweat and vitamins for quick recovery from fatigue.

Potassium salt (e.g. potassium phosphate) shows the contracting activity on muscle and the stimulative activity on nerves. Citric acid, tartaric acid, malic acid and fumaric acid, can be used singly or together and as potassium salt, potassium dihydrogen phosphate, potassium phosphate, dipotassium hydrogen phosphate, potassium polyphosphate, potassium pyrophosphate, potassium metaphosphate, potassium tartrate, potassium chloride, etc. can be used singly or together.

As bitter component caffeine, tannic acid, hesperidin, naringin and bismaroma, can be used singly or together. 20.5.78. as 059510 (5pp5)

CSPK-★ D13 04478C/03 ★J5 4154-571
Food seasoning and preserving agent - prepd. from aminoacid, organic acid and salt mixt. using wine and alcohol
CSP KK 25.05.78-JA-062483
(D16) (05.12.79) A231-01/22 C12g-03

Matured seasoning is prepd. by dissolving amino-acids and their salts in starting wine, adding other seasonings agents and glucose soln., putting the mixt. in a closed vessel, degassing it, maturing it at ca. 25°C for 24-48 hrs., crushing it, screening it, mixing concd. ethanol having ca. 95% concn. with it and maturing the mixt. at below 20°C. By using various kinds of wines (e.g. 'sake', grape wine, fruit wine, whisky, 'mirin', etc.) various kinds of matured seasonings can be obtd. and they can be properly combined in various foods. (e.g. bread excellent in texture, water-holding property, preservative

property and volume can be obtd. and the ice cakes excellent in taste, texture and overrun can be obtd.).

Typical aminoacids are: alanine, arginine, arginine, hydrochloride, aspartic acid, sodium aspartate, sodium glutamate, glycine, histidine, histidine hydrochloride, i-leucine, leucine, lysine, lysine hydrochloride, lysine-aspartate, lysine-glutamate, methionine, phenylalanine, proline, threonine, tryptophane, valine, arginine-glutamate. Typical additives are- sodium chloride, potassium dihydrogen phosphate, sodium succinate, succinic acid, citric acid, lactic acid. 25.5.78. as 062483 (7pp5)

Butter type product mfr. - by adding vegetable oil to fresh milk and souring before beating

DAIRY FND RES INST 31.06.77-SU-493964

(11.05.79) A23c-15/02

Butter type product is obtained by adding vegetable oil to fresh milk, separating at 60-75°C, pasteurising the cream fraction, cooling to 8-10°C, then warming to 20-25°C, adding a culture of lactic acid bacilli, homogenising in a single stage at a pressure of 15-17 MPa with cooling to 6-8°C, and finally maturing for 3-5 hr.

The method permits production of a range of products with a fat content of 30-60% in equipment used for normal butter without using expensive stabilisers and thickeners. Process time is reduced 6- to 7-fold, and the products have the flavour of butter with a homogeneous texture and good spreadability.

4-Cyano-tetra:hydro-furan-3-one(s) and 4-hydroxy derivs. - intermediates for 4-hydroxy-3(2H)-furanone(s) useful as flavouring agents

GIVAUDAN CORP 14.12.77-LU-078691 (11.08.77-LU-077955)

E13 R29 (01.01.80) *GB2002-380 C07d-307/60

Prepn. of furanone cpds. of formula (I) (where R is H, methyl or ethyl) comprises subjecting a cpd. of formula (II) to cyanohydrin cleavage by thermal treatment at 50-400°C or by treatment with a base at 50-200°C, in the gas or liq. phase.

Cpd. (II) may be prepd. by oxidising a cpd. (III) of formula (II); where OH is replaced by H in a polar solvent at

pH 3-11 and -10 to 60°C. Pref. a caroate, e.g. KHSO₅, is used as oxidising agent. Cpds. (I) are known flavouring agents. Cpds. (II) and (III) are stated to be new. 26.7.78 as 928136 (5pp927).

BRUN/ ★ D13 05137C/03 ★US 4181-743

Food flavouring, esp. salt substitute - prepd. by heating condensed plant juice, has low sodium content

BRUMBLICK G C 15.09.76-US-723512

(01.01.80) A231-01/22

A low sodium food flavouring is produced by extracting juices from plants, condensing the juice, and toasting the condensate with radiation of sufficient intensity and for long enough to alter the flavour of the condensate. The juice may be obtd. from yeasts, mushrooms, fruit, vegetables, grasses, nuts, cereals or fermented vegetable matter.

The compsn. has a pronounced salty taste and so is useful for those on low sodium diets. It may be in liquid, paste or solid form. 15.9.76 as 723512 (10pp955).

GROW/ ★ D13 05138C/03 ★US 4181-745

Decorating shells of eggs - using medium contg. salt and dye(s)

GROWE G H 03.01.78-US-866356

(01.01.80) A231-01/27

Shells of eggs are dyed by (a) prepg. a dyeing medium contg. (rock) salt and dye; (b) wetting at least portions of the shell with water or vinegar; (c) applying the dyeing medium to the wetted areas of the shell. Pref. the dyeing medium is in a transparent flexible bag.

The method is simple, and does not require a liq. dyeing soln. 3.1.78 as 866356 (4pp955).

STAL ★ D13 05140C/03 ★US 4181-747
 Pasteurised vegetable seed fibre for use in foods - having light colour, bland taste and low calorie content
 STALEY A E MFG CO 04.12.78-US-966246 (07.11.77-US-849289)
 (01.01.80) A231-01/27

Crude fibre-contg. seed hulls esp. of soybean or corn are (a) mixed with water; (b) the slurry obtd. is kept at pH 2.5-5.0; (c) heated to 155-180°F for 15-60 mins. The solids are then (d) dewatered; (e) washed with water; (f) dewatered and (g) dried.

The prod. is useful for increasing the fibre content of foods. It has a low microbial count, and a low calorie content. It has a bland flavour, and light colour even when seed hulls with dark coloured hilums are used, if the conditions of temp. and pH are chosen correctly. 4.12.78 as 966246 (8pp955).

CORP ★ D13 05141C/03 ★US 4181-748
 Wet and dry milling of corn kernels - to give starch and animal feed from protein and corn fibre residues
 CPC INTERNATIONAL INC 11.05.78-US-904838
 C03 (01.01.80) A23k-01

Continuous, corn refining process comprises dry milling whole grain corn to give an endosperm fraction, germ fraction, fibre (hull) fraction and a cleanings fraction. The endosperm fraction is steeped, the larger wet endosperm particles are sepd. from the smaller ones and milled to smaller size and combined with the original smaller fragments. These are then again steeped to give a mill starch slurry. This is sepd. into fine fibre tailings, a starch rich fraction and a protein rich fraction. This protein rich fraction is concentrated and combined with the fibre (hull) fraction, cleanings fraction and fine fibre tailings and then dried to give an animal feed. The product shows no loss of corn oil or germ fraction.

The product is an animal feed. The corn starch may be used to produce sugars. 11.5.78 as 904838 (11pp916).

 Liq. chromatography system for detecting aflatoxin - has packed flow cell for improving fluorescence detection
 VARIAN ASSOCIATES 31.08.78-US-938738 (10.12.76-US-748867)
 J04 R16 (01.01.80) G01n-21/34

Aflatoxin in a sample is detected by passing the sample through a liq. chromatography column and passing the out-flow from the column through a flow cell packed with aflatoxin-adsorbing particles to establish a dynamic equilibrium of the aflatoxin between the mobile phase and the particles. The flow cell is irradiated with electromagnetic radiation of a frequency to cause the aflatoxin to fluoresce and the emitted fluorescence detected.

Used for detecting aflatoxins, e.g. aflatoxins B1, B2, G1, G2 which are toxic metabolites of fungus that under certain conditions can grow on peanut and cereal plants. The fluorescing species which are in equilibrium between the stationary phase and the mobile phase in the flow cell can be detected at lower concn. thresholds than when they are in equilibrium only with the mobile phase. 31.8.78 as 938738 (7pp67).

 Automatic popcorn popping machine - with popcorn and oil introduction, popping, and discharge under cam control
 VANDEWALKER JR 12.09.77-US-832626
 (08.01.80) A231-01/18

The machine includes a vessel with a separable bottom cover which can be moved from a first position in which it forms the bottom of the vessel, and a second position to permit the contents of the vessel to be discharged. An electric heater is thermally connected to the cover. A rotary stirrer extends into the vessel. A corn dispensing and measuring device introduces unpopped corn into the chamber. A measured amount of oil is separately introduced.

The power supply to the machine includes a rotating cam to control the sequence of operations. The cover operating device includes a lever having a portion bearing on the cam surface. The cover is normally biased to one of its positions and the cam acts on the lever to move the cover to its other position against the biasing.

The machine may be coin operated. 12.9.77 as 832626 (9pp295)

TOMA/ ★ D13 05223C/03 ★US 4182-232
 Curd mixer for making cottage cheese - with horizontal mixing combs which do not twist paste of curds and water
 TOMATIS S 31.07.78-US-929788
 P13 (08.01.80) A01j-25

The mixer includes an elongate basin having an upwardly concave bottom wall and a pair of end walls. There is an inlet through one of the end walls near the bottom of the basin, and an overflow opening in the opposite wall near the top.

A mixer has plunger arms provided with elongate mixer combs extending perpendicularly from the arms parallel to the bottom wall. There is a drive for the plunger arms. Curds and water are fed to the basin using a conveyor screw.

The appts. permits continuous prodn. of paste for making cottage cheese. 31.7.78 as 929788 (5pp295)

Measuring properties of materials by irradiation - esp. density and thickness of webs by measuring transmitted radiation of two types
PHILLIPS PETROLEUM CO 21.04.78-US-898554
A35 F07 K08 R16 (08.01.80) G01n-23

Properties of a material are measured by passing radiation through the material from at least one source. The radiation is of two different types. A first detector responding only to transmitted radiation of the first type. A second detector responds to both types of radiation transmitted by the material. Signals from the detectors are combined to give a measure of the intensity of the second type of radiation transmitted by the material.

The method may be used to measure the density or thickness of a web, e.g. of polypropylene fibres, heavy gauge plastics film, paper, films of food, and metal foil. A high energy beta-plus-gamma emitter can be used to measure denser materials over a larger period than a pure beta emitter. 21.4.78 as 898554 (7pp1312)

Loading packages with food slice stack - by swinging placer with spring loaded doors and ejection ram

CHEMETRON CORP 30.01.78-US-873177

P62 (08.01.80) B26d-04/44 B26d-07/06

A stack of sliced food is removed from a slicer by a conveyor. The stack is eventually transferred to a discharge conveyor which delivers the stack to a placer. A pair of spring-loaded doors within the placer grip the stack of food while the placer swings from the conveyor to lie above a packager. When in this position, a ram extends through the placer to load the stack into a cavity within a

package.

The discharge conveyor can be rotated about a horizontal axis to clear the placer while it is swinging. This conveyor includes a retractable stop at its lower end. An escapement intercepts food stacks and delivers them to the discharge conveyor in a controlled fashion.

The appts. transfers stacks of sliced food into cavities of packages. 30.1.78 as 873177 (23pp295)

Prodn. of water free from spores and suspended particles comprises reverse osmosis of completely desalted water. The overflow from the osmosis unit is passed to a levelling container.

Residual permeate is recycled with the feed, which is purified and chilled before passing to the reverse osmosis

unit. The prod. is used to prepare medicinal injections and for technical applications. 1.9.77 as 739335 (9pp047)

MANN/ ★ D15 03652C/03 ★ DT 2826-922
Municipal sewage treatment - with loading of aerobic and anaerobic stages depending on specified conditions
MANNCHEN W 20.06.78-DT-826922
(10.01.80) C02c-01/06

A biological treatment system of effluents with a surplus of nitrogen, esp. municipal sewage, applies aerobic and anaerobic methods in alternating successive basins. The distribution of the inflow to the individual basins is controlled as a function of the type and content of the biologically digestible components, the inflow rate, and the trends of the pollutants and of the inflow rate.

This ensures that before the start of a peak load with nitrogenous cpds., enough nitrite and/or nitrate is present to reduce at once the matter, which is harmful to a nitrification, by means of biosludge and of the fixed oxygen in nitrite and nitrate.

In a municipal sewage plant contg. a preclarification, a first aeration basin, a first denitrification basin, a second aeration basin, a second denitrification basin and a reclarification basin, the recycled sludge from the reclarification basin goes to the first aeration stage.

At night, most of the small amt. of sewage is directed into the second denitrification basin; the first aeration stage receives little, except the clear water from the sludge digestion plant. This produces much nitrite and nitrate which passes to the second denitrification basin for reaction. During the daytime the proportion of sewage going to the first stage is gradually increased.

In the case of heavy rainfall, the principle of oxidation and elimination of nitrogen in the first stages is maintained. 20.6.78 as 826922 (9pp39)

 Organic, partic. acrylic polymer prepn. - by UV irradiation of thin film of monomer aq. soln.

RHON-POULENC INDUSTRIES 09.06.78-FR-017857

A14 (09.01.80) B01f-01 C08f-02/46

D/S: E(BE, DT, FR, GB, IT, LU, NL, SW)

Organic polymers useful partic. as flocculants are prepd. by subjecting to UV irradiation an aq. soln. of an olefinically unsatd. monomer in the form of a thin film deposited on a mobile support under the UV source. The atmos. above the photopolymerisation medium is kept humid throughout the process until the aq. soln. becomes solid.

The polymers are soluble in water and are free from water-insoluble fractions. The process also avoids formation of "onion peel" type insoluble fractions.

 Drinking water etc. disinfected with corona discharge negative ions - by bombarding thin film of water from high potential electrodes

EMBUDEC 31.03.78-FR-009563

(30.11.79) C02b-03/02

The water surface is increased by forming the water into a thin film, which can be moving or stationary, or into an emulsion. The water surface is bombarded with negative ions produced by corona discharge from a set of pointed electrodes. The electrodes are held at an electric potential w.r.t. the surfaces in contact with the water. Part of these surfaces is pref. an electrically conductive material with an earthed connection.

The thin film of water can be produced by running the water through a shallow channel beneath the electrodes. Alternatively, the film can be formed by water overflowing to run down surfaces faces by a set of electrodes.

The system combines efficiency of disinfection with simplicity and very economical usage of energy. The treated water does not possess an offensive flavour which can result from chlorination. 31.3.78 as 009563 (9pp448)

 Waste material handling system - in which food waste disposal units supply slurry to single press for water removal

HOBART CORP 05.05.76-US-683475

P41 (16.01.80) *US4032-446 + B02c-18/40 B02c-21

A waste material handling system includes waste food disposer units for forming a slurry, conduits for connecting the units to a press for removing water, check valves in each of the conduits for blocking the flow of slurry from towards a unit while allowing flow slurry away from a unit, and devices to enhance the flow from the units to the press.

Pref. a pump is associated with each conduit to move slurry toward the press by directing a liq. flow through a nozzle in the conduit. 15.4.77 as 015824 (9pp1376)

 Lifting and lowering mechanism for sludge scrapers - which responds to signals from torque meter and works without damaging, frictional overloads

SALA INT AB 28.11.75-SW-013429

(16.01.80) *DT2653-791 B01d-21/06 B01f-07/18

A circular settling, thickening, sludge or mixing tank has arm which extends across the tank bottom mounted on a vertical pillar such that the arm can be raised and lowered, and a elongate rigid element connected at the sidewall of the tank and to the pillar to transmit torque derived from rotation of the arm to the sidewall while allowing vertical movement of the arm.

Pref. the element is pivotably mounted on the sidewall. A sensor is pref. provided to monitor the transmitted torque. A simple pillar construction is possible when the torque is counterbalanced by the sidewall. 23.11.76 as 048769 (10pp1376)

FARB D15 23336A/13 =GB 1559-449
 Semipermeable membranes comprising aromatic polyamide - with di:sulphimide gps., for ultrafiltration and reverse osmosis

BAYER AG 24.09.76-DT-642979

A88 J01 (A23) (16.01.80) *BE-858-937 B01d-13 C08g-69/32 C08j-05/18 + B01d-31

semi-permeable membrane comprises an aromatic polyamide contg. disulphimide gps., and having a relative viscosity, Z_{rel} , at 20°C., as a 0.5 g/dl soln. in N-methyl pyrrolidone of >1.4 . Pref. 20-80 mol.% of the aromatic polyamide w.r.t. the total amt. of the structural segments derived from the diamines or dicarboxylic acids consist of structural elements contg. a disulphimide gp., ≤ 80 mol.% of the structural segments consisting of other aromatic polyamide.
